The Handspring GPS also works for the 700 as well. Was playing with one
hooked into the 700 via serial cable and the GPS in the slot for the feed.
You can find the handspring on ebay for a decent price still.

I have a Garman Streetpilot that has worked well for me but it only has
NMEA out.
I was considering one of the other, larger units like the GPSMAP 162,
168, 176, 182, 188, 2006, 2010, 232 or 238. I am going to put this in
my Dodge RAM truck so the larger size will fit and make it easier for
me to glance at and get sufficient information. The Streetpilot display
is large enough but does not accept NMEA input. the GPS III/III+ is too
small for me. I have a GPS II+ that is fine for Just seeing the data
and if i were using a laptop with APRS or mapping software it works out
fine. The Streetpilot also does not have maidenhead grid display that I
would find usefull when Roving.

Like I said before I recalled someone posting that one of the GPSMAP
units offered good value because of NMEA in/out, works with the D700 to
display positions on the map, and was WAAS enabled. I just can't
remember which unit was mentioned.

Maybe the next revolution in TNCs will include a PSK mode so that we don't have doppler problems at higher baud rates while mobile. I guess many commercial mobile data services already do this...

G'Day

At the moment most Garmins allow it, except for the base model ETREX units. Basically if you are buying a GPS you need to look at it and make sure it has NMEA INPUT.

I recently put information on http://www.radio-active.net.au/web/tracking/antitracker.html that referes to this... Although it does not mention the D700 by name. I am just using the same capability for my anti-tracker.

Compatible GPS recievers include The Garmin GPS12, MAP168, GPSII+, GPSIII, GPSIII+, EMap(updated Software) , Etrex Venture, Legend, and Vista(with updated software), Garmin 45, StreetPilot III(with 2.11 and above software), and the GPS 12xl.

The GARMIN Etrex BASE MODEL WILL NOT WORK Neither will Garmin GPS-V, Garmin Street Pilot (First Version).

But there are reports that the european ETREX base unit will work with the D-700.

Having said all that, Wes Johnston has convinced me to definitely include the ETREX upload code using the GARMIN protocol in my AntiTracker, and I may end up doing a both ways converter that will allow an ETREX to work with the D700 with the updates. I will see how that goes - I don't have an etrex yet... That will arrive Monday I hope.

If you would like to add this to your page, here is a review of another Taiwanese GPS unit, the GM-200 which I reviewed on this list about a year ago:

First Impressions -- Holux GM-200 GPS "Mouse"

I just received a Holux GM-200U GPS "mouse". This is a combination GPS antenna and receiver similar to the RandMcNally, Delorme Tripmate or Pharos 180. The unit is available in 3 versions:
1) A serial version with DB-9 (data) and PS/2 (5VDC power) plugs at the end of a 6-foot cable for use with a laptop serial port. Operates on 4.75 to 5.5 VDC

2) A serial version with flying leads (supply your own plug(s)) at the end of a 6-foot cable for operation on 6 - 40 (!) VDC. Obviously intended for direct operation on 12 VDC car power but also would work in a 28 VDC system in a HumVee, truck, etc.

3) A USB version that connects to both data and power through a single USB port.

The unit has a full bi-directional serial interface that can be used to update it's internal flash memory firmware, or force inititiizing coordinates and time into the unit. On the serial versions, a separate diffferential correction input is present (on the DB-9-equipped version, it is pin 9 of the plug).

The device is packaged in a case that looks extremely similar to the Microsoft "ergo-mouse" but slightly smaller. It is available in 4 colors (White, Black, Red or iMac-style translucent "Bondi Blue"). The entire underside of the unit is covered with a rubbery magnetic material similar to refrigerator door gaskets that clings powerfully to automotive sheet metal. Just don't throw this thing into your computer bag with other cables and peripherals! The rubber coating has enough surface tack to keep the GPS from skidding around the top of my plastic dash without Velco (which I have used on my RandMcNally and Pharos units). Overall, the unit has a solid quality feel, with a well strain-reliefed heavier-guage cable that feels much more rugged than the flimsy cable on the Rand McNally.

Electrically, the unit is a 12-channel SIRF design with a real-time clock powered by an internal rechargable lithium battery which the manual says will keep the clock alive for 1400 hours (57 days). At the end where the cord comes out, an array of 4 yellow-green LEDS provides a power and lock indication One led lights up constantly when powered but not locked. All four LEDs do a disco walking lights effect (any one remember Knight Rider?) when tracking.

The unit powers up by default at 4800-8-N-1 WGS84 dataum continuous reporting once a second, and outputs the GGA, GLL, GSA, GSV, RMC, and VTG sentences. To the manufacturer's credit, the small 18-page manual actually lists the structure of each sentence. If you want to override the defaults, you can switch it to one of 69 (!) other datums and change the baud rate to 9600, 19,200 or 38,400.

I have the USB version which comes with a driver to create a virtual serial port in Windows 98x or Win 2K. Windows Plug-N-Play offered to install either a generic MS-provided driver for a USB port device or the vendor-provided drive (whih actually seems to be the driver for one of the USB-to-serial cables so common now). It wound up as "COM5" on my Dell 3000 laptop. This is no problem for Street Atlas 7 thru 9, MS Automap, MapInfo or APRSplus which worked perfectly. It was a problem for the 16-bit non-registered version of UI-View (which like any 16-bit Windows 3.x or DOS program won't recognize comports beyond COM4).

This unit is a really tidy solution to the "only one serial port on a laptop problem" for APRS programs. I connected the one-and-only "real" serial port of the PC (under APRSplus) to the Kenwood D-700's TNC, and fed the GPS data to APRSplus through the USB port virtual COM5. APRSplus works perfectly with this arrangement. [I could have used a normal serial GPS connected directly to the D700, I could have used a serial-interfaced GPS connected directly to the D700, but this is much tidier since the GPS draws it's power from the USB connection.]

Using the USB port is desireable from another standpoint also. I suspect the USB port is less prone to wearing out (or pins breaking) than the serial port (a horribly expensive proposition on laptops where the serial connector is part of the motherboard).

Hello:

A fellow ham who is stationed over in Kuwait right now and myself are trying to find a suitable location for a APRS digipeater in the S Minnesota / N Iowa area, and were offered space on a decom AT&T microwave relay tower. The problem is there is no useable power on the tower for a digi. The ham in Kuwait (N0AIM) e-mailed me that he was thinking of solar power for a digipeater. I can't say that I have ever heard of this being done with any reliability at our latitude. He was thinking of using a Morningstar SunGuard-4 Charge Controller and SunWise 20W 12V panel to accomplish the charging of a deep cycle battery. Does anyone with any experience in this wish to point me in the right direction... Is that large enough? Will it work at all? My feeling is that with long winter nights here in Minnesota sometimes stretching from 1645 - 0800 and longer before any useable rays are seen, and several cloudy days in a row at times in the summer, that even a 5w digi at 20% ALOHA would put us into negative power budget. Thanks in advance... Feel free to reply on-list or off... I'd enjoy seeing the dicussion

No, but they apply to traffic that is retransmitted by another IGATE.
The ACA (regulatory authority in Australia) only permits me to transmit
packets which are from licensed amateurs and I have no way of knowing
that "TAC-1" is a licensed amateur.

Frankly I don't understand why it is necessary to use fake callsigns in
the packets. If you want to have tactical callsigns shown on a map, the
mapping software should support aliases for each callsign.

Its not Doppler, its mobile flutter caused by multipath.

You might check about the no power.

I heard that often there are generators on those
sites. At least they advertised this way.

Subject: [aprssig] Solar Power for a Digi?

Hello:

A fellow ham who is stationed over in Kuwait right now and myself are trying to find a suitable location for a APRS digipeater in the S Minnesota / N Iowa area, and were offered space on a decom AT&T microwave relay tower. The problem is there is no useable power on the tower for a digi. The ham in Kuwait (N0AIM) e-mailed me that he was thinking of solar power for a digipeater. I can't say that I have ever heard of this being done with any reliability at our latitude. He was thinking of using a Morningstar SunGuard-4 Charge Controller and SunWise 20W 12V panel to accomplish the charging of a deep cycle battery. Does anyone with any experience in this wish to point me in the right direction... Is that large enough? Will it work at all? My feeling is that with long winter nights here in Minnesota sometimes stretching from 1645 - 0800 and longer before any useable rays are seen, and several cloudy days in a row at times in the summer, that even a 5w digi at 20% ALOHA would put us into negative power budget. Thanks in advance... Feel free to reply on-list or off... I'd enjoy seeing the dicussion

Michael,

I have solar powered weather station in south eastern Minnesota. I use a 48 amp/hour AGM battery, SunGuard charge controller, and 32 watt Unisolar panel. The transmitter runs about 1 minute out of every hour. With this setup the battery is usually greater then 80% charged. This is in a non-temperature controlled enviroment (ie a wooden post in the middle of a field). You can see more details about the project (including real time battery data) at: http://wxsrv.jarviscomputer.com/ and the photos are at: http://jamesj.jarviscomputer.com/gallery/wiscoy

For a moderatly busy digi in our neck of the woods I would guess that you would want about 120 watts of solar power and 230 amp/hours of deep cycle battery. You'll need a real deep cycle batttery or two, do not attempt to use a "marine deep cycle / cranking" battery. If you are at an old old AT&T tower you might even have 2 volt lead acid telecom batteries on site :-) I highly recommend Concorde Power's SunXtender line.

Sounds like an interesting project, let me know if I can help. I'm going to school in Ames, IA but drive through Albert Lea often to go home to Winona, MN.

It is easy to calculate. Lets assume you point the panel south at the optimum winter solar angle. Out of a 24 hour day, you will get about 5 hours of good sun (20%). Now Lets assume you have 50% sunny days. That means the average power you will have available is 10% of 20W or about 2 Watts average power.

For a Digi, the RX/TNC is on 100% of the time (100 mA), and the TX is on about 20% of the time. And a 1.5W TX actually draws about 5W DC power. So you need an average of about 50 mA (TX) plus 100 mA (RX) for a total drain of about 2 Watts. (Equal to your average solar power input).

Now lets say you can have times with up to 5 days of no sun. To store 5 days of energy at 2W per hour, you need a battery capable of 240 Watt-Hours which, at 12 volts means a 20 amp-hour battery.

So yes, a 1W solar power digi can be powered with a 20W solar panel if the above assumptions are correct about your average sun. The battery is independently calculated by how long it must run with no sun periods.

Bob,

I don't think those assumptions are correct for the midwest, or even earth for that matter.

> Now lets say you can have times with up to 5 days of no sun. To store 5
> days of energy at 2W per hour, you need a battery capable of 240

A 20 amp-hour lead acid battery is going to de-rate 20% at 32F, and 50% at -27F. It's cold here. But assuming that we never need to de-rate, then we will running the battery to 0% state-of-charge whenever we have cloudy periods or the solar panel gets covered with snow. Constantly deep cycling the battery will wear it out *much* faster. In my opinion it is much cheaper and better to invest in a large battery to start with then buy too-small of batteries every 6 months. See the reference below:

http://www.windsun.com/Batteries/Battery_FAQ.htm#Temperature%20Effects%20on%20Batteries

That's the battery. For un-interruptable solar power you want your solar array to be able to put a lot of charge into your battery bank when it is sunny. In November having no clouds once every week is the best you can hope for. The power generated on cloudy days doesn't amount to anything. In real life I see about 10% output on bright cloudy days.

I have discovered that when a solar system is too small and you start running negative power budget you end up wearing out your batteries and not being able to provide constant power. You essentially end up with a direct drive system: when it is sunny the radio works, when it is cloudy or night the radio is off or resetting. The same as PCSAT.

> So yes, a 1W solar power digi can be powered with a 20W solar panel if
> the above assumptions are correct about your average sun. The battery is
> independently calculated by how long it must run with no sun periods.

I disagree. You panel needs to be adequately sized to charge your batteries when the sun come back. If you are designing your system to run without input for a week, then you need your input to be enough to charge the batteries to support the next period of no input.

> Frankly I don't understand why it is necessary to use fake callsigns in
> the packets. If you want to have tactical callsigns shown on a map, the
> mapping software should support aliases for each callsign.

USER ASSIGNED-ON-RECEIPT TACTICAL CALLS ARE A COMM DISASTER WAITING TO HAPPEN.

Because APRS is designed for "tactical real-time digital communications" in support of emergency/special/local communicatiosn needs. This means people-to-people digital communications. I strongly oppose the concept of user-assigned-aliases-on-receipt because it leads to confusion, ON-THE-AIR.

If a few people refer to the FireTruck-3 as FIRE-3 and everyone else sees W3XYZ-14 on their maps, I can GUARANTEE CONFUSION. Remember APRS is an AUGMENT to human communicatiosn with humans looking at MAP data. EVERY map must be GUARANTEED to be showing all human viewers the SAME THING, or you are using a system that only adds confusion instead of helping it.

Yes, in an "ideal" world with 100% of every operator and every APRS program on the air EVERYWHERE within your EMERGENCY, all taking the time to assign an "alias" in the heat of battle, yes, this is a nice capability. But a receipe for disaster if you have any users in your net with a D7, D700, HAM-HUDS, APRSdos, no FINDU.COM, or any late commers.

COMMS is NEVER "ideal" in the real world! APRS is "come-as-you-are", with now DOZENS of non-homogeneous APRS decodign software out there. In such an environment, any COMMUNICATIONS PLANNER with any sense of the real world would be shooting himself in the foot if he encouraged such a use of end-user-assigned aliases..

Thus, either assign tactical calls to the TRACKERS before the event, or refer to them by their HAM CALLS throughout the event.

END-USER-ON-RECEIPT-ASSIGNED Tactical aliases are a receipe for CONFUSION (and communications failure). None of the D7's, D700's, HAM-HUDS, FINDU.COM, or any latecomer, or APRSdos, or I can think of all kinds of people who wont get the alias assigned correctly. Thus half your

APRS folks will be referring to the same object with two different names, some with a CALL and some with a TACTICAL name. Now throw in about a dozen such dual-labeled, miss-assigned mobiles and you have A receipe for disaster.

I have STRONLGY opposed end-user-assigned-tactical-calls from the beginning. The ONLY WAY I would accept it is if such software that allowed it would ALWAYS DISPLAY BOTH the REAL call and the TACTICAL CALL in Parenthesis EVERYWHERE in the program and on the map.

Anything else, undermines the integrity of APRS as a tactical real-time communications system.

I don't think doppler is an issue for most mobiles.. particularly in the 2m band. Perhaps you are thinking of multipath? or Rayleigh fading?

Probably the biggest problem is that the original packet protocols didn't really address the issue of rapid fading, so a 1 millisecond hit will take out the entire packet. Some alternate encoding (block interleaving, with error correction?) might be better. There has been an enormous amount of theoretical work in the more than 20 years since ham packet was first defined.

I agree that the next go around of ham digital communications should be a bit more sophisticated, but I doubt that PSK is it (multipath is rough on PSK, and it wouldn't solve the fading problem). Anything you want to implement needs to be of a level that a very simple piece of hardware/firmware/software can modulate and demodulate it. Not everyone wants to attach a PC with a sound card to their tracker, for instance. For all the ills of the current AFSK mechanism, it IS possible to build a one chip low power solution for the modem.

Yes, I was only attempting to show him how to calculate the design limits, not how to include all the contingencies that any designer would really use. I agree, completely that for a 20 Ahour discharge requirement, you would want to probably use a much larger battery to keep the depth of discharge low. And again, my assumptions about length of bad weather are a local design factor. The idea was to show him how to calculate these things, not to give him a design...

Can trackers be programmed to transmit objects instead of posits? I
know that the Kenwoods and Ham-HUD can't. However, it seems to me the
easiest way to consistently display tactical call signs and ensure
standard call sign identification as well would be to use objects
instead of posits. Something for software authors to think about.

Over Kill your setup. Add another battery and solor panal. Or a
bigger solor panal.   The main Idea is to create a reserve that will
carry operations for several days longer then the expected dark days.
Then you want the panals to have the ability to recharge the batteries
as quick as possible. Remember while the panals are working your Digi
is using power. We had a digi here that was setup like Bob stated. I
think the main reason it failed is because of over useage. It is
often hard to determine the traffic load of a well positioned Digi.
8) Good luck with it!

Agree completely if you can afford it. But a 20W panel with 5 hours of good sun can generate 100Whrs in one day, which is good enough for the next 4 days of operation. But I think we agree completely. The prudent designer will not take the "average" no-sun periods for his design, but he should take the worst-case no-sun period (plus derated depth of discharge) to choose his battery and he must size his solar panel for the average power plus worst-case one-day-sun between back-to-back worst-case no-sun periods inorder to assure a reliable system under all extremes.

But if the guy already has a 20W panel and a site and wants to put a solar powered 1W digi on it that will work "most of the time" I think my numbers and your cautions are a good starting point.

Bob

Hi all!

Has somebody experiences with packet radio on the Sharp Zaurus?
It's a Linux PDA running Kernel 2.4.6 .
I'm not firm in compiling new packages on this platform...so I'm
asking on this list. Would it be possible to run Xastir on this
PDA? Perhaps in a smaller version?

Bob made some good points and this really needs to be thought out farther. One problem I see the fact that along with APRS there will most likely be voice nets running. Most of your Voice nets will just to use Tactical calls so that when operators change shifts the calls stay the same. In the end you end up with the fact that it is the responsibility of the Ham operator to keep track of the Ham call and the Tactical Call. Other wise the situation Bob stated will still exist between the two nets. In the end you will need to be flexable so that you can handle both networks regardless of the changes.

Rendered body type: text/plain

Good Morning all. I would like to get started in using a pocket APRS system in my mobile station. I have in place now a Kenwood D-700 radio with a Garmin III + GPS. What I would like to do is add a palm m130 pda to this system.

The question is what do I need to get this equipment to show me the maps on the pda (hrdware/software)?

Ron N0ZQR

```
Look at the Pocket APRS software and see if it will run on the m130.
If it will then You will need the cable that hooks to the m130 to a
standard RS232 comport.  Now to make it work with the D700 you need to
addin a Null modem cable adapter.  You can find these at Radio Shack
for around $7 I think.   I don't know if you have the GPS hooked to
the D700 yet if not then you will need to make up the cableing for it.
Look in the manual for the pin out for both the Garmin III and the
D700.  You will need the cable that will hook the Garmin III to a
RS232 comport also if you don't already have it.  That should do it!
I use APRS ce hooked to my D700 and it works great.

I agree, it would not. You probably need more digipeaters in your area.
But the proposal was not about improving traffic in the first place.
It was about creating a reliable digipeater infrastructure. and one of the
requirements is that all digipeaters in the cluster have equal performance
parameters, so that 1 cluster member only can handle all traffic in a
'normal' way.
hope this helps a bit.

I dont see any advantage.  The time it takes to set up a tracker for an
object would be no less than the time it takes to set it up with a
tactical call in the first place..  Unless I'm missing something...

Hi Bob,

Not a question of time for setup.  I bring up the option of using
objects because most software supports displaying objects, objects
aren't restricted to 6 characters, and objects carry the originating ham
call automatically in the AX.25 header.  Just a suggestion for simple,
universal, tactical call implementation.

I'm not sure whether it's currently possible. It's certainly
something to shoot for though. It someone wants to supply one
or two developers with them, I'm sure we can come up with
something... ;-)

Zaurus has a small screen, but if you can do a larger virtual screen
on it (it's a function of the window manager), then you might be able
to use the current version of Xastir on it. Try it and let us know
on the Xastir mailing lists whether it works!

It's possible that with a few minor changes here and there it could
be made to work. If screen size is a major problem, it might take
a lot of changes to the GUI to make it all fit on the screen. That
would be quite a bit of work.

There is another alternative.

Because the D700 already has messaging capabilities, you can use a "Y" cable
off the serial line from the Garmin and send the NMEA OUT to both the
Kenwood and the Palm. Then run a conventional mapping program on the Palm.
Like RandMcNally Streetfinder. The Kenwood handles the APRS and the Palm
only does the street level mapping.

I've seen this setup with another local ham. I don't know how practical it
is for you. It would be more usefull for a "mouse" type GPS. Your Garmin
has a screen and can already display street level maps.

Is it possible for WinAprs to show weather radar maps and automatically
reload these? I want to run WinAprs while mobile and the radar maps load
automatically for my current location. With wireless internet access this
could be done "IF" WinAprs supports it.
Thanks for any input.

I have some captured track data from a recent trip to Savannah. I want to replay it in APRS+ so that I can create a map showing where I was able to get in and where the holes are. Can this be done? If so how? I tried loading the file under the file menu and the data shows up in the tnc window but I can't seem to get it to show up in the history tab or anywhere else.

The data is in a file track1.txt

The format is

```
KC4ZGQ-9>SR5Q6X,NA4V-2,W4GR*,TRACE2-1,qAR,WA4DSY:`oJznsL>/
KC4ZGQ-9>SR5R0S,NA4V-2,W4GR*,TRACE2-1,qAR,WA4DSY:`oJ|o\'>/

Big 'Zip' tie. Secure TNC to radio, slide back enough to clear radio mount holes, slide back up. You may be able to pre-posistion the zip tie, mount the radio and then snug the TNC down onto it.

or

An aluminum plate between the radio and TNC.
Mount TNC case to the plate (remove cover, pull PCB, screw to plate, insulate fasteners - make sure they're short enough to stay out of the TNC's PCB when it's re-assembled!!). may also make some 90 degree 'ears' to take advantage of the TNC's existing case screws - use 'em as mount points to the plate.
Then run the 'through' bolts through the plate and radio to mount radio.
Re-assemble TNC

or

Do similar to above, but use a piece of that 3/4" square aluminum 'tube' many hardware stores stock. You can ensure that the holes for the radio bolts as well as the holes for the TNC case don't overlap - may be a 'neater' install that way.

or

double sided foam tape the TNC to the radio after it's installed.

or

Remote mount the TNC - just run a longer interface cable to the radio
and stick the TNC in between some trim panel. Leave it 'hidden'.

or

gimee time, that was just off top of my head

So far, I'm using the "duct tape" approach.

I'm planning to do a sort of vertical stacker, with screws through the 1500 into the shelves.

Ugly but functional. :o) Any issues with heat dissipation from the already small surface area of the transceiver being further blocked by a duct-taped TNC?

Ev

Contrary to Garmin promo and the included manual current Garmin GPS-Vs DO support NMEA in. I just got one and it displays the waypoints and calls coming from my TH-D7AG just fine. The setup menu reads "NEMA In/Out". I assume this is a software change so older units might be able to be upgraded to do this as well. (Mine has version 2.07)

Don't forget that there is a difference between a Pocket PC device and a Palm. For the Palm M130, you want ftp://ftp.tapr.org/aprssig/palmstuff/palmaprs/

To get by the expiration of the APRSCE, change the date to a date prior to the expiration date.

Arnie, N1BAC

>The GARMIN Etrex BASE MODEL WILL NOT WORK Neither will Garmin GPS-V,
>Garmin Street Pilot (First Version).

Unless you have the European basic yellow eTrex version or the eTrex Camo
(which is just a yellow eTrex that is not yellow anymore). If that one does
not support it then load the newest firmware from the Garmin site, they
added it in later revisions. No, you can't upload the loadmodule for the
European eTrex or Camo to the US version. People tried by renaming the
region file to have the correct product number, but after loading it
doesn't work.

Note that the European eTrex is not only sold in Europe; its just the
multi-lingual version of the eTrex and I know its sold in Canada too.
Vice-versa the US version was also sold in Europe, I got mine that way; it
was sold here before the European version existed.

I have no experience in PIC programming, maybe I should study it some day.
I don't know how hard it is to make a small NMEA to GARMIN two-way
converter, but it looks quite feasible to me. Problem of that solution is
that it is yet another small device to carry with you and which requires
power somehow.

Maybe the best solution is upgrade to a GPS that is just a little less basic...
```

Wishing for a Kenwood with a Garmin protocol will, based on their current
track record with updates so far, forever stay a wish I guess...

Kind regards,

Henk.

Rendered body type: text/plain

HI Michael:
Our installation is at Lat. N 50° 32.601' Lon. W 121° 01.075'. We are using
6 75W Solar Panels feeding AT&Ts surplus 4500 AH Absolyte Battery Bank. This
runs a 30 W VHF Repeater plus a 70Cm Link Radio. 2 Packet Digipeaters and an
APRS Digi. All Runs well atop a 6200 ' Mtn.
Get ahold of AT&T and ask for some of their surplus Batteries. Be prepared
for
heavy load as they weigh about 1100 lbs for each 12 V Bank. Pulle the cells
out of the metal enclosures and 2 husky men can handle each one
individually. We are able to use some of AT&T sites here in Canada as well.
Good Luck
Cheers - Fred - VE7FFK

>> I am befuddled with how I can securely bundle the TNC with it. <<

The heavy duty velcro (both sides plastic, not the plastic and fabric type) available at Radio Shack and elsewhere. Holds almost anything and with a screwdriver you can pry the items apart if needed.

Rendered body type: text/plain

I know I have seen this before, but I couldn't find the info in the archives-

I am trying to see the internet with WinAPRS on a windows 2000 & an XP PC. This needs to go through a proxie server to get to the internet. The one I set up on Windows 98 works great, but as they change to newer operating systems, I lose the old one. It seems to see the server, but doesn't go past it.

I set up proxie in the aprserve.txt file, but it still doesn't get past the server.

Is there a special setup that the administrator needs to do in the server to allow it to go out?
Ideas?

Thanks-
73

One of our local hospitals has become a source for large 12-volt batteries. They use them to start the diesel generators and because of federal rules must replace them every 18 months. They are large and a healthy man can lift one if his back is up to it. It takes me and one other old codger to get them loaded...

Since multiple generators are involved, we get four every few months...

To all,

Below is a link to some images I have put up showing the coverage along I-16 and in the Savannah area. (Thanks Brent for fixing the file; obviously it worked). The problem is not as bad as some have indicated. I was very impressed with the coverage from Metter south. There is only a section from Dublin through Soperton that lacks coverage.

I have the computers/TNCs ready to install Digi_Ned digis. GAARES just needs some contacts in these cities and some RF equipment and we can plug the holes. So if you know any hams in these cities make them aware of the need and have them contact me.

I've had a few people mention over the years they could not get the WAP pages on findu to work on their cell phones. Since they worked fine on mine, I never had the opportunity to debug them (nor did I have much incentive). Thanks to the work of Mark, KD7RHL, I think the problem has been tracked down and fixed. Basically, I used HDML for the pages, while some phones only do WML. I have an alternative page for the WML version of the find page:

http://wap.findu.com/find2?k4hg

Both versions work fine on my phone. I'm considering moving the WML to the primary page, I'd like anyone using the WAP pages to check this new URL, and report to me if the above URL does not work for you. Otherwise in a few days I'll switch the find program, and convert the others to WML as well.

For those who have an internet capable phone and have not tried it, please try both versions. The original URL is:

http://wap.findu.com/find?k4hg

Steve K4HG

Jack,

I would offer one suggestion. The Alinco is less versatile only when used stand alone. When paired with a laptop or Palm device it is as versatile or perhaps even more versatile than a stand alone D-7 or D700. The advantage is that an Alinco DR-135 and a Palm M-100 or M-105 is much less $$$ than either of the Kenwoods are alone.

Overall it looks good.

Remember the first rule of procedure writing: Procedures are almost impossible to change once they have been approved!

Don't list equipment by brand and/or model number unless you have to. Remember Rule One! Ham equipment is subject to change.

Same can be said for software, don't list it by name unless necessary. Remember Rule One!

IMHO tactical callsigns will work ONLY if you're handing out pre-assembled and programmed tracker kits! Most people do not have computers in their cars and connot easily change the programming of their trackers.

Also IMHO there are so few Mic-e capable repeaters, that unless you are writing this procedure for an area that has some, I would not even bring up the subject.

In my experience, the best you can do in an emergency is take stock of who and what you have at the time, then go from there.

Hi Bruce,

I've used with good effect the Garmin GPS Map 76 this way with my D7. Was really neat to see the posits pop up when I enabled the setting, I wasn't just a semi-blind tracker with text readouts on the D7. When I had the time I ran UI-View32 on the work laptop connected to the D7's PC port. Very cool. Used a ring/thumb mini-trackball for mobile work.

The Map76 and a few others seem to be overlooked by dealers and some users since they're in the marine market. I found the layout functional and the waterproof feature, if not the floating characteristics, were useful for winter field work in coastal BC. The newer Map76S has 's'ensors, i.e. a flux gate compass and aneriod altimeter/barmometer plus 24 MB memory vice the 76's very useful 8 MB. Both are WAAS capable however at this latitude and in this terrain usefulness/access is questionable/doubtful. Same connector and pinouts as many other Garmin units, the round four pin connector with 12/13.8 VDC connectivity.

The rubber rand was great since I could jam the unit between the windshield and dash on all the different vehicles I was driving. The internal antenna, MCX connector for an external one, is a quadfilar working well when the unit is vertical.

For me the jury is still out on whether I'd get my own Map76 or the Map76S since even with the nice features of the 76S it's internal antenna works best vertically and the flux gate compass works best when the unit is horizontal. Need more info on the Magellan Meridian units with similar features since they are significantly less expensive in Canada.

Cheers, JD

Roy,

Do you think it would be best to just have a separate reference sheet to address the Hardware/Software? I would like to have it mentioned in some fashion for those who are still in the process of researching it.

I know what you mean about the Tactical Callsigns, but from last weekend when we had to constantly ask people where they were until we finally got them all on the same sheet, so to speak, I think it's a problem that has to be addressed. I just don't know the best way to do it. I'm more than open to suggestions on this. Matter of fact, I'm begging for help! LOL

As far as the MIC-E capable repeaters go, I usually carry a computer with UI-View and AGW-PE plus a couple of radios and scanners. What we've done in the past is get permission from the repeater trustee to have folks use it for dual purpose voice/burst after voice and use the scanner to "grab" the data, and then have UI-View digi it back out 144.39. Can really help extend the range of mobile/remote APRS stations in emergencies. But, I'm open to ways to address this, too.

Jack KE4LWT

Hi Michael,

I've seen a few days worth of responses, catching up after a work period, and
don't feel more specific information is required there. What I do want to
offer is that Minn is not the end of the world ;{D, just north of there is
though! :{D Lakehead University in Thunder Bay, in NW Ontario had quite the
experimental solar program going before I arrived there in '79. Apparently
about the third sunniest city in Canada even with the winter overcasts and
cloud cover.

The project I was working on last fall/winter is running VSAT TDMA comms plus
the continuous duty RX function, analogue seismometer and the digitiser for
it. Admittedly there were 6 to 8 75w panels and similarly 6 to 8 x 100 aH AGM
batteries, depending on the site location, S. Ont., S. BC inc north of 48 and
49 degrees N. plus NWT "above" 60 degrees.

I wasn't involved in the design nor do I have the figures however power
budget is indeed always the key.

Cheers, JD

> cars and connot easily change the programming of their trackers.

Exactly! And I might add changing unproto paths, calls, etc during an emergency is a
major mistake. The local network and it's use should be working right now the way it
would in an emergency with very few exceptions.

>
> In my experience, the best you can do in an emergency is take stock of who
> and what you have at the time, then go from there.
>

Exactly! Formal plans are great...if everyone would read and understand and excercise them....but it just does not happen to any extent, anywhere I've ever been to where it becomes second nature.

I think the focus on how you will interface APRS with all the other plans of your EOC is the most important. This is something that just seems to be over looked time and time again. You are a resource to your Emergency Manager (or whatever you call him). Ask him how he would like it used before you tell him how you are going to use it. It is my opinion that this is how any amateur radio EOC procedure should begin. If you are going to use it, get a wall projector and then show your EM what it is capable of! Messaging capabilities are poor at best. APRS with a wall projector is how we will use ours here in our EOC where we will focus in on the area of concern....showing all the data we can possibly provide to the EOC and Emergency Manager so that they have the "best" picture of what is going on, who is where, weather, etc., and then they can ingest whatever they want to. An EM is not going to take the time to "track". The only one tracking done will be the APRS operator. In fact, the operator will be busier than two rats in a sock posting objects, shelters, gathering data to post, etc. Won't be much time left for messaging. Leave the messaging to other forms of communications which are better suited.

Jim - WA6OFT

Thanks! I'm going to make some of the recommended changes in there. I think the only things need to be tracked are the ERVs for the Red Cross, and any other logistics support vehicles. The one thing we were always asking after the tornados last week was "Where is the fuel truck?" and "Where is the Food?". Didn't need to know, or even care about any other mobile stations. I guess that should be included in there in some form.

Already moved the equipment/software stuff, and made a couple of other changes.

Thanks for the help so far folks! Who knows, I might just come up with something useable!

Rendered body type: text/plain

I had the same issue and used a couple of "super rubber bands" made by cutting strips of inter-tube (harder to find now, for free, in this tubeless world). I put one around both FT1500 and 9612 (same case size as KPC3+) "fore" and "aft" of the FT1500 mounting point. My "bands" are about one inch wide. Be sure to push the one between the front of the radio and mounting point back far enough to not cover the speaker (for non packet operation). I also put a thin piece of foam between radio and TNC (with hole for speaker) so the two didn't scrub the paint off of each other.

I like the RS heavy duty double plastic Velcro also. That stuff will NOT fail between the two pieces of Velcro. I haven't tried it on a surface that is at elevated temperature (i.e. the heatsink case of the FT1500). If the adhesive holds up, and I bet it would, that would be a good solution also.

As a trustee for a club license, I can tell you, that other
than makin' legal calls (since my personal ticket on the
line), I have no more authority than any other club
member. A trustee can be changed for any
reason or no reason.

If the repeater has a trustee, then it is a club station.
I would speak to some of the officers.

Just an idea.

Subject: [aprssig] RE: Draft Emergency Operations Plan for APRS

Roy,

Do you think it would be best to just have a separate reference sheet to address the Hardware/Software? I would like to have it mentioned in some fashion for those who are still in the process of researching it.

I know what you mean about the Tactical Callsigns, but from last weekend when we had to constantly ask people where they were until we finally got them all on the same sheet, so to speak, I think it's a problem that has to be addressed. I just don't know the best way to do it. I'm more than open to suggestions on this. Matter of fact, I'm begging for help! LOL

```
As far as the MIC-E capable repeaters go, I usually carry a computer with
UI-View and AGW-PE plus a couple of radios and scanners.  What we've done in
the past is get permission from the repeater trustee to have folks use it
                                                                  ^^^^^
```

for dual purpose voice/burst after voice and use the scanner to "grab" the data, and then have UI-View digi it back out 144.39. Can really help extend the range of mobile/remote APRS stations in emergencies. But, I'm open to ways to address this, too.

As a general rule, the trustee would be the last word on any Part 97 issue (his/her personal license and money is at stake). How much more, would depend on what latitude the club gives him/her.

A trustee's position is based soley on the good feelin's of any officer.   Any of whom can zip off a 610B to the FCC with their signature and a new Trustee's signature and you're gone.

Some Trustees are really active in the club's repeaters, some know they exist and, as in the case of one at a University near here, probably could not tell you if they had one or more :-)

I disagree with this statement.

> > IMHO tactical callsigns will work ONLY if you're handing out
pre-assembled
> > and programmed tracker kits! Most people do not have computers in their
> > cars and connot easily change the programming of their trackers.

Tactical Callsigns are a great tool for Permanent Emergency Stations and stations where the operator will change from time to time. This does not include routine trackers although it could include a permanently install tracker in an emergency vehicle (ERV or EMA mobile command post). Any operator that is running an APRS client program should understand how to setup and run with a Tactical Callsign before being put in charge of an Emergency Station.

It is far simpler to look at a map and see EOC and know that this is the Emergency Operations Center. Furthermore, this can be determined by looking at the raw packet which is impossible when using the pencil method.

Tactical Callsigns can work if intelligently used. Use them for Permanent Stations that don't often change.

EXAMPLES:

NET -- NET CONTROL
EOC -- EMERGENCY OPERATIONS CENTER
SHLTR#-# -- SHLTR
MOBCOM -- MOBILE COMMAND POST

Don't try to use them for trackers or home stations. This is where Tactical Callsigns get a bad rap when every Ham tries to come up with a catchy "Handle".

I think Jack is on the right track with Tactical calls. They should be pre-defined and published for a given group BEFORE they are needed and it should be explicitly stated that AD-LIB is a no no.

John, If this is you:

http://db.aprsworld.net/datamart/switch.php?call=W0JAB%25&table=position&maps=yes

Then the stations around you are:

http://db.aprsworld.net/datamart/stations-near.php?lat=39.45017&lon=-91.04883&name=W0JAB&bbox_size=1

And it looks like the closest APRS station is 45.19 miles away.

(I was surprised to see you in the database, but it looks like your packet
came through PCSAT ... nice use!)

Your antenna isn't high enough!   :-)

I was surprised, last August, when visiting the folks back in Montana to
see two unexpected stations pop up on 144.39. You never know what you'll
hear when you're close to an Interstate.

Also note that setting up a station on 10.151 when you're out in the
woods is a good way to see some APRS activity and keep the interest up.

The original Kantronics dual port KAM is a great TNC for doing just that. They're
frequently on Ebay at a good price. (I now have three - I can share the secret.)

My first APRS experience was monitoring with NOS and looking up stations
heard by Latitude and Longitude in the State Farm Atlas. I picked up packets
from W7LUS all over the country. That was a blast.

73,
Bill - WA7NWP

I have a desire to place an APRS digi at a repeater site.
The repeater is using a hybrid ring duplexer.
Any words of wisdom as to how to combine the ARPS digi and the repeater to
the same antenna?

Thanks
73

In section 5.3.1 I think the path of RELAY,WIDE2-2 is a good "initial"
choice for mobiles and in some cases home stations, but it should be
followed with the advice to change it to DIGIX,WIDE2-2 for fixed stations
once a path via DIGIX has been verified.

or something like that...

Some followup comments on coments by others:

> Don't list equipment by brand and/or model number unless you have to.
> Remember Rule One! Ham equipment is subject to change.

But That list of radios with built-in-TNC's can only grow. It can never
shrink, because those radios will be around for years and years. I see
nothing wrong with such a list.

> Same can be said for software, don't list it by name unless necessary.

Same for the software, it will only grow...

> IMHO tactical callsigns will work ONLY if you're handing out pre-assembled
> and programmed tracker kits! Most people do not have computers in their
> cars and connot easily change the programming of their trackers.

I think the examples shown had to do with the BASE STATINOS at fixed
sites. Entering tactical calls for them is as easy as entering any other
call... (though registration numbers may be problematic)..

> then they can ingest whatever they want to.

I would be careful of focusing all your energies on this approach.  The
wall projector is absolutely impressive... but practically useless for
real work.  It is comparable to power-point for giving high level
briefings, but what is going on in an EOC has FAR to many different
aspects and what needs to be ZOOMED in on in one instant for one operator
is totally differenmt for another operator.

The GOAL of APRS in an EOC should be to have a MAP/MESSAGE display in
front of every radio operator to be able to focus on what his immediate
comunications needs are...  ALl he needs to understand is how to move the
map and zoom...

> An EM is not going to take the time to "track".  The only one tracking done
> will be the APRS operator.  In fact, the operator will be busier than two
> rats in a sock posting objects, shelters, gathering data to post, etc.

Nor will he have time to focus the large-screen projector on the
individual needs of the 20 operators in the room...  So YES, plan on a
projector, but DONT PLAN ON IT BEING OF ANY VALUE TO THE COMMUNICAIONS
PEOPLE.

They must have individual displays at each COMM position for that. That is
why APRSdos has ZIPlan mode so that every laptop in the room can be
```

clip-leaded (Pins 2 and 5 of the serial port) to a single run of zip cord connected to ONE TNC/RADIO so that every laptop can independently see what each individual operator needs to see...

See README\ZIPLAN.TXT in every version of APRSdos...

I have used APRS at such facilities, and the large screen display is absolutely impressive... but when it boils down to actually helping the communications operators get the tactical picture of what is going on, it really does not accommplish that in the long run...

In the States, the traffic transmitted by the other IGATE would be sent as traffic under the license of the person running the IGATE radio. That person would be obligated to make sure that the transmission meets the regulations. Included in that is the necessity for that person to make sure that *his* transmissions are identified properly with *his* callsign as appropriate. While the CONTENT may come from me, the TRANSMISSION comes from the IGATE owner. The TRANSMISSION is what must be identified (at least under US regulations).

>The ACA (regulatory authority in Australia) only permits me to transmit
>packets which are from licensed amateurs and I have no way of knowing
>that "TAC-1" is a licensed amateur.

In that case, then you would perhaps be in a better situation if you did not transmit messages that came from a station using a tactical callsign.

(Your situation could generate considerable headscratching on this end, as I try to figure out the ins-and-outs of another country's amateur radio rules. But the result is really simple: I'm responsible for making my transmissions meet the requirements of the laws and regulations for the country I'm in. I cannot be responsible for the actions of another amateur, especially one in another country with different laws where I don't know the laws and they aren't my laws anyway. Sorry.)

For those of you who don't have a WAP enabled phone and might be curious on what
this looks like. Goto:

http://www.DigitalAirways.com/DAW/appletpage.asp
(You need to use IE 5.5 or greater to get the Javascript to run correctly.)

and enter:

http://wap.findu.com/find2?k4hg

and press the "OK" button...

Now you'll be a WAPen!

Well... I am working on that. I have just managed to get a PIC to upload
a position to the eTrex. I now need to write some parsing code... My
first task is very much an UPLOAD of waypoints, since I need that for my
anti-tracker.

I am unsure if the code will fit in a 16F628... I may need to go for
something a bit beefier. I expect to have the basic parsing code dome
sometime later this evening. I need to think about a revenue stream for
myself for some of this work - I needed to buy an eTrex especially so I
could write this code. I at least want to break even, particularly since
I don't have a day job any more.

Once I have this code I will integrate it with the anti-tracker and
finish that project - and get a version one PCB made up.

```
To all plus abc( changes made to foil Lyris and allow a better subject line
hehe)

xyz Below is a link to some images I have put up showing the coverage along
I-16 and in the Savannah  area.  (Thanks Brent for fixing the file;
obviously it worked).  The problem is not as bad as some have indicated.  I
was very impressed with the coverage from Metter south.  There is only a
section from Dublin through Soperton that lacks coverage.

I have the computers/TNCs  ready to install Digi_Ned digis. GAARES just
needs some contacts in these cities and some RF equipment and we can plug
the holes. So if you know any hams in these cities make them aware of the
need and have them contact me.

Fair enough. But you could help the situation by not using unnecessary
tactical callsigns.

Third party traffic agreements differ from country to country and we
should be aware of that too. For example, I don't believe Australia has
one with the USA!

Well, the clubs I've been in, the Chairman of Repeater committee
has say so over repeater operations (other than legal matters) of the club's
repeaters.   Often, the trustee is not even on the committee.

Same-same Field Day, etc. The Trustee doesn't dictate anything, other
than that the FCC Regulations be followed. There is no requirement
that he/she (not the pervert kind) be present.

No such power is given in Part 97.

Must be different where you live.

While you could be replacedon a whim, you, as trustee, have the legal
right and responsibility to make such a decision, especially on short
notice, like an emergency...

> real work.

Gee Bob! We used it twice now in an activated EOC and it was the only thing
that worked at one point.
I do not know how you come off saying this, but in our application, it is
simply not true.
Fact is, the plan was modeled, in a far less fashion, from a tactical field
command post from the USAF.

 It is comparable to power-point for giving high level
> briefings, but what is going on in an EOC has FAR to many different
> aspects and what needs to be ZOOMED in on in one instant for one operator
> is totally differenmt for another operator.

Bob, every EOC can be and normally is different, based on need, room,
personnel, etc.
We use it as a picture of the entire scene.

>
> The GOAL of APRS in an EOC should be to have a MAP/MESSAGE display in
> front of every radio operator to be able to focus on what his immediate
> comunications needs are

Depends what you are using it for. To me, this would be a waste of a

limited resource
for our EOC. And, it does not relect what an EM would use it for. Again,
there is no such
thing as a "standardized" EOC and that has never been a requirement of an
EOC to conform
to any such standardized plan. (Ref: FEMA/EMI's IS-275 EOC
Design/Ops/Management/Excercises)

> > An EM is not going to take the time to "track". The only one tracking
done
> > will be the APRS operator. In fact, the operator will be busier than
two
> > rats in a sock posting objects, shelters, gathering data to post, etc.

> Nor will he have time to focus the large-screen projector on the
> individual needs of the 20 operators in the room... So YES, plan on a
> projector, but DONT PLAN ON IT BEING OF ANY VALUE TO THE COMMUNICAIONS
> PEOPLE.

It's use is NOT FOR THE COMMUNICATIONS PEOPLE, in our case. We use it for
providing the EOC personnel
with all the data we can, as I said earlier. As operators, our mitagation
procedures insured we are getting them the data they need. How they ingest
it, no one can know until that point in time.
Our EM/Team will tell the radio operators where they need to be and then
they would take it from there and do the best they can. APRS would serve no
purpose for us in that application.

Your plan sounds quite impressive, Bob but totally unpractical in 99% of
small town USA where people and funding is very limited.

Jim, WA6OFT

There are over 4000 APRS station in the world. It is impossible to
please everyone.
However the programmers are working hard to do so.   In this light
they have been
Creating filters most of which will filter out callsigns and tac
calls. I understand your
problem. Unfortunately there is no way for you to fully understand
the reasoning
behind the way someone sets up there station. There for the best you
can expect is
to setup your station appropriately. If it means using a filter to
remove that station then
Remove it.   It is good to bring subjects like this up. It allows
the readers to look at
there setup in the big picture.

> > once a path via DIGIX has been verified.

> Why not leave the path generic? what if DIGIX is going down?

Actually, I think you are right, and Bill Vodall also called me on that.
I DO think that the best path for fixed stations is WIDE,WIDEn-N for
several reasons:

1) It is not dependent on any given hardware path
2) It allows for flexibility in operations
3) It launches packets in possibly opposite directions more efficiently

The only disadvantage is that it might generate some extra dupes. So to
be politically correct, I recommended switching to DIGIx,WIDEn-N to cut
down on that possibilty when used by non-skilled APRS operators who are
paying no attention to their load on the network...

But WIDE,WIDEn-N is the best path as long as the user is sensitive to, and
monitors his impact on the system..

Thanks for raising this point...

4) A collision at the sole DIGIx machine might kill the packet entirely. With a bit of redundancy in the first hop, the packet is more likely to successfully enter the network.

5.) Murphy's law. Even if your DIGIx is the most reliable digi in your network, the one time there's something serious happening and you really need it, then it will be down. Better to have extra packets now when it's not critical then to have no packets when it is critical.

>The only disadvantage is that it might generate some extra dupes.

If the Dupe-elimination software in the digi's is not recognizing the duplicates due to the different "first digi" field - then the digi's should be fixed.

>be politically correct, I recommended switching to DIGIx,WIDEn-N to cut

I suggest, off the record, that it's better to use "WIDE,WIDE2-2" then to use the PNW official "DIGIx,WIDE3-3".   The shorter hop count should more then make up for the extra duplicate packets.

>But WIDE,WIDEn-N is the best path as long as the user is sensitive to, and
>monitors his impact on the system..

Yes. The more generic we make the system the better.

Note: A plain WIDEn-N path for base stations is 8 bytes more efficient, but then we lose the path origination information.   I've been gathering data based on path origination and it makes for some very interesting info.   For example, here's the list of the actual stations first-digi'ed by my Digi_ned node in the past day.

   http://www.jnos.org/javAPRS/tnc/REDMND.tnc

Having the data allows plotting it on JavAPRS to compare it to the coverage circle.

Bob...

Welcome to Texas APRS. I have traveled extensively over the state (and our neighboring Louisiana) and have been frustrated once I crossed to the east of IH-45 (the Houston to Dallas Interstate). The area is an APRS desert; Arkansas was also until recently. Once you cross the Mississippi, there are not many gaps.

My travels have taken me all over the eastern part of the country and before I leave, I give my kids the hotels and general routes we will be taking. I drive hard but do not stick to a planned route (I love back roads and secondary highways) so to assist them in case of an emergency I send them the findu URL to track me and it works great except in East Texas and Louisiana. Bush International is the southwestern corner of this dead area....

We also have very poor coverage along the middle Texas Gulf Coast, an area very prone to hurricanes. There is almost nothing between Houston and the southern tip of Texas. The inland area is very sparsely populated, one of the counties (part of the King Ranch) has less than 500 residents, but the coast has several significant population areas including Corpus Christi.

Joe Dorn, W5VEX, Belton, Texas

Just a Houston, TX data point:

I was very pleased to have APRS HT coverage around NASA JSC, but I was
never able to get into a digi from the International Airport north of
town...

Just thought I'd mention it...

In todays world of travel (and "terrorism" targets), the Airports should
be a high priority for at least a RELAY (callsign substituting) digi..

not complaining at all.... keep u p the good work!

```
Joe....you're right.

I live in NorthEast Texas, between I-20 & I-30. I & others have tried to get
some clubs in this area interested. A digi was unofficially put on the air
in Tyler about 18 months ago. However, their digi'ed packets would rarely
make it to the nearest I-gate in Dallas or Lufkin. I have not heard the
Tyler digi or seen it on findu for months now.

I have my backyard digi (N5EQT-1) on the air here at home. It covers about
half of the county. I would move it to a better site if there were one
available. As I said above, the local clubs aren't interested in sponsoring
a digi and tower space for avocational use (read: free) is all but gone
since the tower companies started buying towers from cell phone companies,
2-way shops, etc.

I guess it's a case of good news & bad news......good in that it is really
quite around here, RF wise......bad in that it is really quite around here,
RF wise.

de Ken,
N5EQT

I'm puzzeld why you think attaching a Yaesu 1500 to a KPC-3 (that *is* what
we're talking about, isn't it) using velcro would result in a reduced
airflow.

I would assume that you would mount the Yaesu on top of the KPC-3, not the
other way around.

Without a fan, I'm assuming that the cooling is done by convection.  Blocking
airflow from "under" seems detrimental.  Unfounded concern?

Rendered body type: text/plain

Greetings from not so sunny southern NH!

I've built and maintain the club's 2M repeater and my own APRS WX digi here in southern NH. The repeater runs from a bank of deep cycle golf cart batteries and high quality solar chargers (ie Morning Star series) that go into PWM when topping charge commences. The same system runs my APRS WX digi.These batteries are rated at 250 A/Hr a piece at 6 V. So a series parallel combination gave me 500 A/Hrs.
Total consumption of repeater and WX Digi is about .5 (1/2) amp during idle times! On cloudy days, the panels actually put out 1.3 amps... still a net positve gain. See pix at http://w1wqm.org of repeater

We also have a remote RX input for the repeater on a water tower, it too is solar powered and also has a Digi co-located. This one presently has a 64 watt flexible panel (Solarex) and a 30+ A/hr gel cell. Rigs installed are FT-530 for the remote RX for repeater and an HTX-202 for APRS w/a KPC-3.

My experiences....
Use modern HT's with low power consumption when in RX mode. (Yes, I know about those in RF jungles who say nay! We've had that discussion here B4!)
Use big solar panels, they even charge my two sites on cloudy days! I've purchased only 3 new ones since starting this project. All others have been found in want ad's, auctions, and word of mouth sales.
Golf cart batteries need water about once a month, so very remote sites require more expensive batteries that require little or no water.
Use chargers with PWM to help give longer life to batteries.

Yeah, I couldn't stay away. As some of you know I sold the BIG truck and went sailing. Well after 3 1/2 years of playing boat I ran out of money and reality set in! I am back right where I was before, well almost, I am back with North American Van Lines, back in the exhibit group, and back with my old dispatcher, Lois Clark! Whata name...but the best dispatcher I have ever experienced! The only thing not the same is the truck I am driving and the Aprs setup. I will, however, order another even better truck then the last (you can view it and the boat at www.qsl.net/w7lus)probably within 6 months. Another "big bunk" for sure. The Aprs set up for now is a PCMCIA card by Merlin that is offered by Sprint and is known as an "air card". It is for data only and has it's own phone number to ID it. Sprint is of course the internet provider. Presently I am using a port on Aprs internet that doesn't not send any data to me but receives mine. However someone, WF6H, sent me a few mwssage lines but I never got any acks back from him because he was to many hops away, I guess. If someone can find and send him a one liner explaining this it would be appreciated. At least I think I received those line real time unless they got in outer space and got hung in my computer...hmmm that would be spooky!

Eventually I'll probably hook up the HF and VHF when the new truck arrives.

Looking forward to sitting down having an eyeball with some of you again.

So i n a nut shell...I'm baaaaack!

What duty cycle are you anticipating? Is this a heavily-loaded digi that will be transmitting all the time (even then the max duty would be < 50%), or just a tracker/end-user rig. If the latter, the duty cycle will be so low, I doubt that cooling air flow will be an issue. [And you could set the tx for 25W out instead of the max 50.]

Hi Stephen,
The application will include bursts of time of very high duty cycle, followed by long periods of low duty cycle. Reducing power won't work. I'll need every watt I can get.

In APRS terms...it's a tracker, but one in which the operator will be prone to bursts of use in keyboard-to-keyboard messaging with other operators.

It sounds like this unit runs fairly cool as a normal course of events. I guess I've got to decide if I'm willing to give it a go or sell it and go for a 2600m that can mount a TNC within the mounting bracket.

Thanks for yout insights.

Ev

Rendered body type: text/plain

> How long is PCsat expected to stay up? If/when it comes down are there
> plans to put another one up?

PCsat is in full sun and fully operational 24 hours a day through 22 Nov (only 4 more days) and then it begins to enter eclipse cycles again where it runs its batteries dead in the dark every orbit. But it will remain operational in the sun until the Nicads short. Which after months of such abuse will come soon...

PCsat will be in orbit for more than 100 years. But we dont expect its batteries to last more than a few more weeks. We invite every new satellite to support a digipeater on 145.825 if such a mission is compatible with their other missions so we have a continuous packet digipeater on that frequency.

We have another Naval Academy satellite for next year that will operate on the same 145.825 MHz digipeater frequency for about 1 year
on primary batteries. It has no solar power, so when the 7000 Watt Hours of batteries (112 Lithiums) die then it too will die. It is called ANDE.
See the WEB page...

PCsat WEB page   http://www.ew.usna.edu/~bruninga/pcsat.html
ANDE WEB Page: http://www.ew.usna.edu/~bruninga/ande.html

>That's how I operate mine. No problems at all.

In fact, the other 1500 mounted on top of that one, is my SSTV rig, and goes key-down full power for 30S
 at a time, as much as 50% duty cycle.

: Roy,
:
: Do you think it would be best to just have a separate reference sheet to
: address the Hardware/Software?  I would like to have it mentioned in some
: fashion for those who are still in the process of researching it.
<snipped>

Jack,

    Many plans use appendices to address issues subject to change like
hardware and software, with the main body of the plan referring to them
where appropriate.  The problems lay with getting a responsible person to
keep on top of things and getting any revised appendices distributed to
those who need to see them.  Of course any plan or revisions should be made
with those who use the guidelines in mind and with their input.

Gents,

Someone got a explanation for this ?

Why would a digi ditch the RELAY and repeat the WIDE, when it could have repeated on "RELAY" ?

```
VK4TEC>APRS,VK4GME-3*,WIDE <UI R>:
VK4BBS>APU254,RELAY,WIDE <UI C>:}VK4AGS-8>RS52U1,TCPIP,VK4BBS*:'O({l >/]"44}
VK4BBS>APU254,RELAY,VK4GME-3* <UI

If this is a base station (it looks like that because of the APU2xx =
UIView)
why does this have the RELAY word in it's unproto path?

Doesn't this radio have rather effective cooling fins on the back of it?
Wouldn't it be more prudent to assure good airflow behind than on the top or
bottom?

```
If the digi is setup to digipeat on relay and wide it is possible that
a colision happened during the relay so the digi did not hear it. but
it did hear another digi use the relay.  So being the first time it
understood the packet it digipeated it as a wide.  I'm sure this is
only one possible reason and there are others.

Yes!  The only thing you really need to worry about is if the case has
a vent.  If so then try not to cover it.  Other wise you can mount it
anyway you wish.  If it does have a vent then leave atleast a 1/4in
space between it and the object you place over it.

Both the FT-1500 and FT-2600 work great for APRS.  I have one of each.  The
1500 is in the car with a TTII and the 2600 is a digi at home using a
MFJ-1270C and UI-VIEW.

Just don't make the same mistake I did in the car.  I have a Town Car which
has a huge trunk so I thought I would mount it vertical on the back wall
with a small fan to get a little better circulation.   What I didn't take
into consideration was that the gas tank is 1/16" behind the wall.
OOPS........

Was able to patch with sealer and screw.  I know better NOW....

I'd think that the location of the antenna might be more interesting, if indeed it is a concern at all.

456. [aprssig] NOSaprs 1.15b3 available - WIDE & WIDEn-N digipeating

From: Maiko Langelaar <maiko@langelaar.net>
Date: Tue, 19 Nov 2002 11:44:05 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-107822-2002.11.19-12.22.48--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Greetings,

Release 1.15b3 of NOSaprs is now available as a complete upgrade
kit (not a patch this time) from any previous release of NOSaprs
for JNOS and TNOS.

I have also added fresh new DOS and Linux binaries (executables)
of JNOS (version 111f) that have NOSaprs 1.15b3 compiled in.

This latest release will let JNOS or TNOS do WIDE or WIDEn-N
digipeating just like a real APRS digipeater. I have code in
place to check for duplicate frames to avoid the situation of
WIDEn-N frames bouncing back and forth endlessly between NOS
and other digipeaters on frequency.

Note : Feedback is welcome. This is still ** EXPERIMENTAL **

Please MAKE SURE you read the release history notes for the
above new feature as well as other enhancements and fixes.

The website is as follows :

http://www.qsl.net/ve4klm/packet/aprss.html

Best regards,

Maiko Langelaar / VE4KLM

Rendered body type: text/plain

I recently purchased a D700 and find it A+. Unfortunately the D700 has a
few short comings and I wonder if others have a work around for the
following:
        No Mic hang-up box which should disable the PL and stop scanning
when Mic is removed.
        No priority scan for the scan banks.
        Unable to program PL for TX only.
        Scan stops on active channel even with PL Tones? No audio from
speaker?
        Different PL for TX & RX
        Longer cables. (Just makes fuse block to under dash or under seat
never to battery.)
        Better Head mountings.
I guess I'm just use to commercial rigs.
Ron

>Is a transmitter that close to the gas tank a good idea?

Only if his Lincoln is powered by Hydrazine...or some other RF reactive fuel. Fords do have a nasty habit of spontaneously combusting though, that would be my big concern... The Econoline Vans (especially ambulances), the Crown Vic, the Towncar, and the Grand Marquis have all been plagued for the last decade or so with fuel Tank overpressurization problems. I have seen it in Mustangs, too. Maybe some sealer and screw will act as a pop-off valve...

I was waiting for someone at Phoenix Baptist hospital once and watched a Ford Ambulance pull into the emergency entrance. The EMT's wheeled the patient inside and seconds later the unoccupied Van burst into flames. Ford is going on 40 years with "industry leading" gas tank and fuel delivery problems now; you'd think they'd be able to get it right sometime. My brother had a '67 Mustang, and the gas tank was fiberglass and dropped into the trunk, thus the top of the tank was the bottom of the trunk. The problems with this design became apparent to me when someone rear-ended the car and broke the uni-body/frame behind the rear axle, and the gas tank cracked and spewed gasoline inside the car. Fortunately it was a low speed collision and the tank was almost empty at the time. Ford did not change this design in Mustangs until 1971...5 model years after the problem became apparent in real world driving situations.

And I'm sure most people remember the Pinto!

Of course, if it's a bad design, it's a bad design, but I don't think
there's
any 'generic' reason why you can't install back at the gas tank 'area'.

I'm not saying screw your ground into a hole in the tank! I'm just saying there's no propblem with puting the radio back in the trunk.

Pic Programmer project for the next Amateur Satellite:

I mentioned the SIX 500 mW lasers on our next amateur satellite project
operating in the 808 nm range that should be able to be seen with a low
light level CCD camera and good lens (maybe?) (anyone confirm? Assume
500 mw optical power dispursed over a 90 degree beamwidth).

On Tue, 19 Nov 2002, Al Tencza responded:

> Bob, In Dec 92, Electronic News presented a build article for a Light
> Beam Communicator called Air Hop.... using a Fresnel lens... Perhaps if
> ANDE had a prerecorded ... message... to modulate one of the 808 nm
> beams then an Air Hop type receiver could be used to receive... it

Great idea! All we need is a PIC programmer to program a PIC with 6 TTL
outputs to key these messages simultaneously at a 7 WPM rate, one for each
orthogonal laser.

HI HI HI HI HI HI HI...
CQ CQ CQ CQ CQ CQ CQ...
73 73 73 73 73 73 73...
ANDE ANDE ANDE ANDE ANDE...
and two others...

They cannot be long sequences because the different strings are needed to
be able to visually determine the optical SPIN rate of the satelite, so
any one lazer may not be in view very long...

This can all be done in a SINGLE PIC chip and XTAL. Can someone familiar
with PIC's give me a size and power budget for this circuit...? and be
willing to program it up in the next month or so? We CAN FLY it maybe in
place of the current dumb on-off keyer that ANDE was going to use... This
circuit is needed by Jan if not before...

If you're not hung up on the PIC, I can do this in an AVR, in an 8 pin dip with no crystal or other
external components.

No, it doesn't.  The entire lightly-ribbed clamshell die-cast [not sheet
metal] case is used as a heatsink.

If you're concerned about the gas tank exploding when you key the
transmitter, well, don't be.  Practically any useful amount of gas in
the tank will ensure that the space inside the tank is above the UEL
(upper explosive limit) - that is, there is too much vapor to ignite,
not enough oxygen to support combustion.  I'd have to pull out the
trusty NIOSH guide to be exact, but the explosive limit of gasoline is
actually a fairly narrow range, something like 12-21% if I recall. So if
there's more than a quart or two of gas in there, it's pretty safe.
```

Although if there are any leaks, then those COULD ignite and eventually
involve the tank as well.

I'd be more concerned about an APRS system with an antenna mounted on
the rear somewhere near the gas fill nozzle, keying automatically during
fueling. But with vapor recovery nozzles in common use now, even that
is a real small probability. But you are supposed to turn off radios
and other non-intrinsically safe devices while fueling, but who really
pays
attention ;-)

It's 1 percent through 11 percent in air by volume. Textbooks say 1.4% to
7.6%, STP, but I'm told by chemists and chemical engineers that the 1% to
11% is a better guide.   Also remember that all flashpoints listed by the
EPA are closed-cup and just determine the initial ignition point of a
flammable substance. Actual combustion usually takes much more energy to
occur.

If car companies and the government were really concerned about liquid fuel
tank explosions/fires, they could mandate aluminum mesh tank liners in all
new vehicles. Cars, trucks, boats, trains, aircraft...   But it would
probably add 50 bucks to the cost of an average personal vehicle, so it

probably won't happen anytime soon.

A couple months ago the local TV station had one of their "sensational" news stories on the evils of using a cell phone while gassing up. Somebody had video taped a fire starting on the security cam.   The individual gassing up had starting pumping gas, when back in to the car, picked up the cell phone, got out of the car, walked back and had a "static spark" start the fire. This was obviously shown in the video and the TV report mentioned it "low key" in one sentence. The balance of the news clip was on how dangerous it was to use the cell phone.

It's not the transmitters that scare me - it's the folks climbing in and out of the vehicles.

Just realize that the FACTORY mounting for the high-power Infinity
stereo amp in the Cirrus type platforms is UNDER the rear deck,
in the trunk area.

And the factory mounting for the Infinity Spatial system, with the
bi-amped speakers, in the LH platforms is again on the SIDE of the
trunk. With the factory recomended 'ground reference' for the amp
being a tab on a member just about 8 inches above the gas tank
and to the left side...

Think they know something we don't know?

Oh, I wonder, how many people even KNOW where their gas tank
is located in their vehicle? It used to be fairly common, under the
trunk. Right in a 'crush zone' in an accident. Not smart. (Like the
old trucks that put the filler cap right by the drivers window, and
configured so that if the vehicle had any forward movement while it
was on it's side, it would unscrew and open the gas cap!)

Hmm, maybe the factories DON'T know better.

Seriously, I have my Alinco 590 in the trunk. Grounded to the
'reference ground' tab. But I didn't drill down. I put velcro on
the bottom of the thing and it stays put on the carpet....

(And yes, I DO know where my gas tank is in my Intrepid. And
in my Jeep Wagoneer. That's why I put a trailer hitch on the Jeep,
even though I don't own a trailer.)

Mike

The Kenwood radios are more expensive...

	FT-1500m	D-700
Xcvr	$129.00	$590.00
KPC3plus	$170.00	n/a
TNC Cable	$ 15.00	n/a
	-------	-------
	$314.00	$590.00

...and they have too many limitations, when it comes to the application I'm developing.

Ev, W2EV

On my THD7-A HT, keying the PTT stops the scan without transmitting. There was a thread quite some time back about people grabing the PTT and talking without transmitting when the radio had stopped during scan and they wanted to join in...

>   Unable to program PL for TX only.

Do you mean RX Squelch only? On the THD7-A you get TX only (T on display) and TX with RX Squelch (CT on display for CTCSS). Is the D700 different in this regard?

>   Scan stops on active channel even with PL Tones? No audio from
>speaker?

Haven't noticed this on my THD7-A

Of course, when you add the fact that the Kenwood is essentially two radios in one box, it is actually cheaper per band than the monobander. Especially when you consider that unlike most dual-banders, both halves can be on 2M at the same time.

Though admittedly, the KPC3+ has capabilities far greater than the built-in TNC in the Kenwood.

Of course, if you REALLY want to go whole hog on this thing, set the Kenwood internal TNC to band A, and connect a KPC3 to the 6-pin mini-DIN external packet connector on the D700. Select band B by pressing the volume button for that band. Now you can run TWO APRS systems at once on different freqs/bands, or even do a crossband digi by connecting the serial ports of both TNCs together with a null-modem cable......

Yaesu insists that you use the mounting "foot" supplied with the 1500, since the whole case is the heat sink. As such the distance from the KPC3 to the rig would be the same as the distance from any mounting surface. Believe me the rig can get HOT! I would not mount it without using the supplied mounting foot.

>>I mentioned the SIX 500 mW lasers on our next amateur satellite project
>>operating in the 808 nm range that should be able to be seen with a low
>>light level CCD camera and good lens (maybe?) (anyone confirm? Assume
>>500 mw optical power dispursed over a 90 degree beamwidth).

Yes this will infact work. I have much experience with lasers and infrared spectrum. 90° is a bit wide for a beam spread but if collimated correctly, this should be a fine way to go about it, especially with communications. I'd LOVE to help in any way I can either technically or morally in seeing this get done.

I'm not sure what else we can do at this point to help it work better.
I hsve the AVR outputting the messages in CW properly, it's basically ready to go.

I have all the SRAM and EEPROM unused, and one I/O pin open.
I have used roughly 25% of the code space.

Of course, if you use an Alinco DR-135T (either with the built-in TNC or an
external unit), you can use the ext. pwr jack to turn the radio on and off
with the ignition. This will also keep your vehicle from beaconing all day
long while you are at work. A very handy feature.

Rendered body type: text/plain

Having recently completed a request for funding through the canadian
government to establish APRS an asset to our Searh and Rescue operation
we learned a great deal about proposals.
Ours had to be very specific and detailed to get the funding. I made the

mistake of describing some specific equipment. In the year or more it took to "win" the proposal things changed, new equipment came out and software and many other unforseen things and each change was met with great resistance and took much discussion to modify it.
use generic names ie a Terminal Node Controller..not a Kantronics KPC-3+ that locks you into tight place.
even gps models can be a problem as new ones come along and others are outdated .
also I did not include specific radios simply because the Kenwood family of radios with built in TNC did fit in my old frame of thought about doing things as cost efficiantly as possible ie using existing equipment..
Ps ..I see Alinco is introducing a dual band APRS capable radio any one seen one.??

I see APRS as a tremendous tool for search and rescue and emergency coms. I live in the mountians, there are no cell phones and very limited repeaters outside of the local amateur ones ,the mountain top repeater near my home is at 6200', and covers an area that is immense 130 miles in diameter and maybe 3000 people live here 20 of which are hams and 3 of which use the repeater.APRS has found a special niche!
If any has question re the SAR_APRS proposal we worked on e mail me directly or on the list so any others can see the response as well.
Kevin Deckert, SAR Manger Clearwater SAR, emergency comms officer

Rendered body type: text/plain

I have mentioned, on this list, in the past the Tri-M Systems Smart Skymaster combination GPS Patch Antennna and 12-Channel Receiver.

[New low price and order info after recap of my previous post for the benefit of those that missed my original info.]

This unit is packaged in a 2" diameter, 5/8" high white plastic package similar to the standard antenna-only round GPS patches.

A coarsely-threaded 3/4" hollow steel stud about a 1/2 inch long sticks out of the bottom. You drill or punch a 3/4-inch hole in the vehicle roof or deck lid, insert the unit from the top and spin a matching plastic wingnut onto the stud from the bottom.

An 8-pin mini-DIN cable with a right-angle plug (same connector used on Macintosh serial ports) plugs into a female DIN socket in the center of the stud. The total clearance required under the mounting surface is about 1".

The other end of the 8-foot cable has the usual 9-pin DIN plug (for PC serial port data) and PS/2 plug (to tap 5VDC from a laptop's ext keyboard connector). The 8-pin connector in the receiver has a pin with a 1 PPS TTL timing output, but the cable assembly doesn't carrry it to the DB9 -- you would have to make your own cable by cutting up a Mac serial cord.

A cigarette-lighter plug with integral 5VDC-out switching regulator is included to power the unit if you don't want to use a laptop. This regulator caused massive RFI to the standard AM broadcast band and the 160/80M ham bands so I replaced it with another switcher I packaged in a heavily-shielded die-cast box.

I made a mag-mount adapter for this device by punching a 3/4" hole in the top of the cap from a Right Guard spray can, mounting the Skymaster on it and then gluing some magnetic rubber gasket material to the bottom with silicon rubber adhesive.

The unit automatically starts outputting $GPGGA, $GPRMC, $GPGSV, $GPVTG, $GPGLL, and $GPGSA strings at 4800-8-N-1 when powered up. I have had one hard-mounted on my Passat running continuously 24/7 for over a year now with excellent results. It simultaneously feeds my D700, laptop and a TigerTrak tracker. The 12 VDC drain with an 85%-efficient switching supply is about 70mA.

Having the antenna AND receiver roof-mounted has a considerable advantage. When the receiver is remotely located, the antenna must have a high-gain preamp in it to offset the astronomical coax loss, at 1600MHz, of the RG-58 or smaller cable typically used to connect remote GPS ants to receivers. These 15-20dB gain amps, are located directly behind low-Q broadband (not-frequency selective!) patch antennas. They easily overload, desense and go out of lock when you pass within a half-mile or so of the ever-increasing number of 1.9GHz PCS cell sites in urban areas. [Or if you frequent mountain tops with 2GHz microwave systems on them as I do!]

In the past, I was amazed to see that cheap "mouse-type" GPS units (such as the Delormes, Rand McNally, Pharos, etc) sitting on my dashboard inside the windshield actually remained in lock far better than a more expensive unit with remote external antenna. The common characteristic of all these units is that they use a PASSIVE antenna connected directly to the receiver front end with essentially zero feedline. With no active electronics in the antenna, they are far more immune to PCS overload.

This device is manufactured (or is it imported from Taiwan??) by Tri-M Engineering at:
http://www.tri-m.com/products/systems/smartskymaster.html

Quoting from the Prairie Geomatics website (their Canadian distributer located in Manitoba, CA) at:
http://www.prairie.mb.ca/tri-m.htm :
"Not just an antenna... but a 12 parallel GPS and antenna in one small, roof-mountable enclosure. Perfect for vehicle/motorhome use with a laptop running any of the readily available mapping programs. Power can be supplied by the included cigarette lighter plug or from the PS2 port of a laptop
NEW PRODUCT - NEW LOW PRICE ---> $114 US <--- $185 CDN"

Remember that with NAFTA, there is now no tarrif or hassle ordering stuff
from Canadian dealers from US addresses.

Rendered body type: text/plain

I am working on turning a MDT-870 (old Mobile Data terminals from police cars) into packet stations for APRS/ARES use.

It has a 80c85 processor in it (Yes I know it is old, but the county has 160 of them for us if we can use them) and I am looking for some assembly code or something that is just not a description of the protocal to convert to this box.

Any leads I can take?

Yes.   I think the best recomnedation is to throw them in a dumpster and send them on their way to a landfill...   Trying to convert an aged MDT into an APRS terminal is like trying to convert a 1974 Ford Pinto into an airplane.

I'll second everything Stephen said about the Smart Skymaster. I have
one and have been very pleased with the performance.

> This unit is packaged in a 2" diameter, 5/8" high white plastic
> package similar to the standard antenna-only round GPS patches.

I'll mention that the unit can be painted so long as you don't use a
metallic paint. (Asked the distributor and mine is now painted.) The
web site shows them as black which would have worked well with my black
vehicle. White wasn't such a good choice.... One tip there - I called
an auto body shop and asked them if they could paint it for me the next
time they were doing a black vehicle. I took it down on a piece of
cardboard and they did a very nice job of it. I've done painting before
and have the equipment, but paint doesn't come in small quantities.
This was a much better option. On the roof it's barely noticeable.

> You drill or punch a 3/4-inch hole in the vehicle roof

I found a 3/4" hole was just a bit tight and had to file the edges
slightly. YMMV

> from Canadian dealers from US addresses.

They do have a US distributor as well, but the Canadian one was much
more helpful so I ordered from them. Very fast service and nice people
to deal with. I wanted to know how long the cable was and the sales guy
took one out of the box unrolled it and measured it for me. It's 10'
BTW.

Bill

I guess my question would be of anyone has tried to get this to work with
pocket aprs for a emergency deployment station? Might be handy to have for a
weather station for the fire season. Have a weather station that is
transmitting WX at the fire command post. I was thinking of the
handspring,GPS, D7, and the weather station with the module..
Thanks

Here in the brutal heat and intense sun of southern California, I definitely
WOULD NOT want the thing painted black!  It would almost certainly cook
itself to death.  The original white is the only color to have here.

>anti-tracker.

You can make an better anti-tracker! There is hacking software floating around on The Internet to replace the Icons in the eTrex with other Icons. There exists a "Land Release" and "Mountain Bike Release" for hikers and bikers. I have been thinking about an APRS Release by putting in APRS Icons in the eTrex instead.

When you have an eTrex with APRS icons then it should be possible to put the correct icons on the screen and making a kind of mini viewer that is better when just having bullits (when using the Garmin protocol you can select the icon you want). Of course this would be restricted to the eTrex, but that is also one of most affordable GPSses with a screen.

If you don't want to mess with the firmware you can of course also try to map the APRS icons to one of the stock icons that fits best.

Just an idea - I think you definately need a bigger PIC processor :-) :-)

Kind regards,

Henk.

488. [aprssig] USB to Serial and Dallas Semi / AAG wx station...

From: "Mike Yetsko" <myetsko@insydesw.com>
Date: Wed, 20 Nov 2002 16:21:11 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-108022-2002.11.20-16.06.22--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

A couple of quick questions...

First, I'm writing an application that use a weather station (just
pressure,
temp, and hum) and I want to try to use the roof top unit that used
to come from Dallas Semiconductor (the 1-Wire thing for use with
the T-238) as an 'aux' input for wind direction and speed. Not to
mention a second temp, and maybe add the rain bucket too.

Anyway, while I have two serial ports on my machine, I also use them for other things.

One time, quite some time ago, I saw a 4-port serial hub that ran on
the USB. Is that still being made? Or is my best bet to just get a
4-port
USB hub and then put in USB-serial cables as needed?

The other question concerns the weather unit. For direct PC use, it uses the serial to 1-wire converter. Are the RS-232 levels on a USB to serial converter robust enough to then power a serial to 1-wire converter to power the station? Anyone try this yet?

If not, I will have to try it... But I thought if maybe someone else
already
did they might give me some 'heads up'.

Oh, finally, I just ordered one of the weather units from AAG. Any feedback, pro or con, on dealing with them and getting the product from Mexico to here? I put the units on a credit card, but they only accept "Pay Pal".

Mike

The weather stations sometimes don't work on regular PC serial
ports, depending on the voltage.  You might get lucky.

They also only ship FedEx to the U.S., which will cost you something
like $30 or $35 just for shipping.

A friend just bought one from them a couple of weeks ago, and he got
it very fast.

I want to get one too, but it's not high enough on the list yet.

No way to know.  It's totally bogus in all respects.
232 was never meant to power anything, period.
That being said, they have the same drive specs as anything else, so it could work.

One of these days, there will be a TNC-like device that takes 1-wire weather directly, and GPS input.

We just finished adding support for this into Xastir a few weeks ago. I borrowed one for this exercise. We use the OOW (One-Wire Weather) daemon to talk to it, and then Xastir talk to OOW. Seems to work well.

Greetings Peter,

As much as you are due your vacation / retirement, it certainly will be great to have The Travelling Ambassidor of A.P.R.S. back on the road again !!!

Your many journies across N.A. really caputured the "spirit" of what APRS is all about ! (And many thanks for the numerous talks and demo's which you gave to the young folks; it was (and will be great !!!!)

And, <grin> as always, I'll be keeping an "eye" on your movements !

Welcome back, Peter !!!

Rendered body type: text/plain

I will be testing the emergency beacon in my D7 this weekend. The call will be N0WRE-7 and the status text will be: testing If you see this on your screen please ignore it as I will be at the house monitoring it on my home PC. I am planning on a back country hike next weekend and will be using the system only for emergency to perserve the batteries. I am going to post this to several lists so if you get more than one copy then I am sorry for the duplication.
Thanks,
Peter- N0WRE Cheyenne WY USA

Hey:

I came across this on Slashdot today and find it kind of interesting.

http://slashdot.org/articles/02/11/21/017201.shtml?tid=126

I wonder just exactly how many people are gonna pay up to 65$ a month for something like that.

Maybe not individuals, but I know someone with 400 rental houseboats that would be interested. Not to mention half the trucking and cab companies in the world. It's very annoying when a driver dissapears with a $250,000 Vactor Truck...and doesn't answer his radio or cell phone. Now we can figure out which "adult entertainment" lounge he's at without having to drive around town. I used to work for a newspaper and one of our Teamster drivers "quit" his route in the middle, leaving a very expensive Propane-powered Step Van by the side of the road, with the keys in the ignition, and 4000 undelivered newspapers in the back. I found him in a tavern 2 blocks away and he was 3 sheets to the wind. It took about two hours to realize he was overdue and to find the truck. We then had to wait another hour for a replacement driver to show up. That kind of behavior among drivers was not that uncommon.

If I coulda offered something like this 4 years ago to clients, I'd be living in Las Vegas right now, instead of Sioux Falls... ;)

73,

Mark

More than you might think. And, the size they're talking about is
pretty reasonable. It's not compatible with Cows In Space, but
certainly worth modifying to get there!

I guess then that we might be able do deal with multipath using a GPS aimed
yagi, or a dynamically aimed patch antenna to get a stronger signal from a
single direction, into the digi.. I am trying to address this issue for
mobile ATV usin a GPS aimed 3-element yagi. But, a dynamically aimed patched
antenna might create less of a scene driving down the road...

Unfortunately they are just suggestions.   According to my UI-VIEW map right
now, using the list, there are about 5 ambulances, 15 aircraft that haven't
moved in at least 4 hours, 12 motorcycles, 5 buses, 9 helicopters, a couple
of bicycles, 3 fire vehicles, 3 balloons, 23 trucks, 9 jeeps, and at least 4
sailboats in houses.  :))

And that is just in IN & KY.

502. [aprssig] 18 wheeler problems

From: "W7LUS - Peter" <w7lus@winlink.org>
Date: Thu, 21 Nov 2002 8:34:13
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-108079-2002.11.21-09.18.30--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Actually the problem isn't with the truck but I certainly am having grief with something within the laptop. W4ERL thinks it is Win 98! If I leave the Sprint air card enabled and AprsPlus running after a rather long time the screen kinda goes wierd. I can't really tell much because when I try to find the problem all I get is an error message from the operatig system that I have run out of resources or something like that. All I can do at that point is reboot.

One other mnor problem is when I bought the GPS at Radio Shack I forgot to get the power/data cord. A data cord comes with it but you already probably know that a GPS just won't run long on its batteries. I called Radio Shack and they have zero assc. I called Megellan they gave me some other local places...nothing! So I have ordered the cables and a mount from the Internet and will have those when I hit home next week about Monday night ot Tuesday.

JOe, W4ERL, suggests I install Win XP home. That means I should upgrade from 64meg mem, replace the 4 meg hard drive....man what have I gotten myself into. Probably what I should do is go to my boat and get my HF and VHF rigs buy anther mobile screw drive antenna and spend a day or so installing in a truck that I dodn't intend on keeping for no more than 4-6 months! What to do? I gues we'll try to get the Sprint air card and the operating system to cooperate somehow, if that is the problem. When all the necessary components are in place and running I am down to resource available of 62 percent. I think that should be ok. AprsPlus uses the most...about 20 percent.

Here's another thought...I downloaded a 2 meg upgrade to flash the air card. After that when I would monitor AprsPlus I wouldn't see any stations come up on the screen but the byte counter was eating up the bytes and the computer simulators in the bottom right tray was flashing like crazy. When I attempted to download an upgrade for AprsPlus the was no dialog box to show up but I was using up bytes downloading but I have no idea where they were going. I dumped the download and reinstalled the orginal Sprint software from their CD and everything came back to normal. Thought I got a bad download so downloaded again with same results. I am just throwing this out there to see if this info might help. I'll try to do the download from the computer at home and if I get the same results then I get to yell real loud at Sprint! Lotta good that'll do!

So any ideas?

I'll get back on Aprs 18 wheeled mobile one way or another, I promise!

Peter - W7LUS

Now that we are making some progress with getting all the WIDEn-N digis in the country on to the NOID standard, so that the originating DIGIpeater data is not obliterated by ID digis, the experiment I am dying to conduct is to get some trucker to just put a TNC (no GPS) on his rig, and set it to beacon once every 10 minutes ONLY a BText via the path of WIDE,WIDE2-2.

Then see if we can track him (without GPS) all over the country by watching the PATH and seeing DIGIx,WIDE2-n.

This is called "viciniity tracking" and is built into APRSdos. It works like this:

If you hear a new station and have no position data from that station,

APRSdos places him on the map (using a big questino mark ICON) within a 1
mile vicinity of the DIGIx where his packet was first heard. The "?" ICON
shows all observers that this is a "vicinity" plot and is not real.
Further, the plot uses an ambiguity circle as well just to make sure no
one missinterprets the plot.

But for long distance travelers all over the country, this is a convenient
way to at least show what town or city he is in. And the REAL neat
thing about it is:

1) It needs no GPS
2) It works in buildings and under things which otherwise block GPS
3) A TNC and XMTR can be built into a cigarette pack and since it only
transmits a single 1 sec packet once every 10 minutes or hour or so, it
can run a YEAR on just 4 AA cells...

A nice way to track objects of HAM radio interest...

Something like this was promised "real soon now" about ten years ago. We looked at it for use down south. Problem was that the operators would just cause it to "turn off" when they didn't want to be tracked. I demo'd it around the canal zone for about a week, worked fine. What we used was basically APRS via satelite to a provider in GB, used the MARSATs as I recall.

Hi all,

A much more practical approach would be to use diversity reception.  The
antenna separation required at 144.30 is large but possible and the
receiver is not all that difficult with todays parts.  Might even be
able to adapt the IF and combiners from old analog cell sites that now
litter the dump.

it would be interesting to see how many people remove the battery from the
unit. a better way to ensure its operation is to hardwire the unit to the
vehicle electric system with a voltage down-converter (since big trucks have
a 24-volt system rather than 12-volts like normal autos) to the proper
voltage.

Yes, spacial diversity with IF combiners would do GREAT to improve APRS
reliability to a given digipeater. But since 99.9% of the digis wont ever
do that, it is probably best if users learn to plan their operations
around normal digis... (which will show only about 30% of the range with a
mobile of a comparable voice repeater)..

Probably

I used a system several years ago that recorded time taged linescanner video on S-VHS tape and GPS position/time and digital photos to HD. Also had a digital map and waypoints. In playback, the GPS time was used to correlate all the data. Unfortunately, I was responsible for setting up the data sites, not for the technical details of how this was done.
David VanHorn <dvanhorn@cedar.net> wrote:

>

Chromapix talks about "caller id" or "CID", but so far, I haven't seen anything that tells how it's encided.

IMHO, APRN only works if we can get the pictures stored as files, with some link to the position and possibly callsign in the file name. With that, we can pull up pictures taken by K8XXX on dec 20th near XX.yyy ZZZ.aaa.

Without it, we are stuck with someone having to view the pix, and save them under searchable file names, which is incredibly tedious.

I think this is why APRN never really happened, because there was no way to really link the picture to the sender, and where it was sent from.

I see huge application here for NWS damage surveys, in that teams could just go out an shoot away, and let the system index everything.
The only thing you wouldn't get from this is which way the camera was pointed, and that should be pretty easy to figure if the pix are shot right.

I have some encoder chips that are easy to get ahold of and use, that can put text on top of NTSC video for callsign and position encoding, but that only solves it partially.

Pic Programmer project for the next Amateur Satellite:

I mentioned the SIX 500 mW lasers on our next amateur satellite project operating in the 808 nm range that should be able to be seen with a low light level CCD camera and good lens (maybe?) (anyone confirm? Assume 500 mw optical power dispursed over a 90 degree beamwidth).

On Tue, 19 Nov 2002, Al Tencza responded:

> Bob, In Dec 92, Electronic News presented a build article for a Light
> Beam Communicator called Air Hop.... using a Fresnel lens... Perhaps if
> ANDE had a prerecorded ... message... to modulate one of the 808 nm
> beams then an Air Hop type receiver could be used to receive... it

Great idea! All we need is a PIC programmer to program a PIC with 6 TTL outputs to key these messages simultaneously at a 7 WPM rate, one for each orthogonal laser.

HI HI HI HI HI HI HI...
CQ CQ CQ CQ CQ CQ CQ...
73 73 73 73 73 73 73...
ANDE ANDE ANDE ANDE ANDE...
and two others...

They cannot be long sequences because the different strings are needed to be able to visually determine the optical SPIN rate of the satelite, so any one lazer may not be in view very long...

This can all be done in a SINGLE PIC chip and XTAL. Can someone familiar with PIC's give me a size and power budget for this circuit...? and be willing to program it up in the next month or so? We CAN FLY it maybe in place of the current dumb on-off keyer that ANDE was going to use... This circuit is needed by Jan if not before...

See the ANDE web page: http://www.ew.usna.edu/~bruninga/ande.html

This may be out in left field, but when win98 installs into a laptop the power management settings are turned on by default, as you well know laptops are there own animal.

You may want to check for sleep modes and screen savers that are interrupting the flow of data.

516. [aprssig] Re: About W7LUS - Back "On the Road Again"!

From: Steve Dimse <k4hg@tapr.org>
Date: Thu, 21 Nov 2002 17:33:30 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-108127-2002.11.21-17.17.43--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

On 11/21/02 at 12:43 PM bruninga@usna.edu (Bob Bruninga) sent:

>Yep, Saw the messages about you, but realized tht you would have GPS
>probably. Im looking for a trucker with just a TNC and radio to see how
>well we can at least see his city...
>

I'm very unclear about why you need a vehicle without a GPS to test this. In fact, the best way I'd see to test this is when there is a GPS, allowing direct comparison of the two posits. I wrote a 90 line perl script which connects to a server, parses a line for the first and third callsign, e.g.:

```
K4HG-8>APRS,KD4BBM-6,WIDE*
```

would give K4HG and KD6BBM-6. The program ignores digi calls containing WIDE, RELAY, or TRACE, then looks up the latest positions of the two callsigns from the findU database, and uses a great-circle calculation for distance between the two. The printout below is the two calls, the distance, and the number of lines "good" (those without W,R,T) and the number ignored.

Here is a little raw output:

```
   KG4QAK    WC4ADG     2.1    1/   8
   VE3OVB    VE3KSR    66.7    2/  13

I used to watch Mitch travel from the Michigan U.P. where he & his wife spent their summers to a southern destination in winter and back to MI in spring. I haven't seen his icon for a couple of years now. Anybody know what he's up to? I know he was not well the last time I heard from him.

73 de Glenn...VE4GN

OOPs, you are right, we can 'test' it anytime we want. I guess what I was really thinking was "demonstrating" it to the non-believers with an actual usable cross country demo and realistic application....

> I wrote a 90 line perl script which connects to a server, parses a line
> for the first and third callsign,... then looks up the latest positions
> of the two callsigns from findU, and... calculates... distance between the
> two...

Wow, Neat!
What I would really like to see is something like this added to your routine FINDU response. Then in addition to the usual response, there would simply be a LINK to the location of the "vicinity" digi that you detect....

Exists: CLICK HERE TO SEE NEARBY STATIONS
Add: CLICK HERE TO SEE LOCATION OF DIGI WHERE HIS PACKET ENTERED APRS

Thus, for packets without a position report, at least we could see what town he was in... or something like that...

Bob, WB4APR

Tnx for the suggestion James. I had done this but don't recall if it was before or after the noticed the problem...it just worked ok for me for a rip I just tried...a whole 33 miles, hi hi. I am headed to Atlanta tomorrow and will put a new set of batteries in the GPS and give it another shot. Keep your fingers crossed, hi!

73 - Peter

Are you seeing anything yet? I looked at your position on findu and it looks like the closest stations are > 40 miles away. Your PHG indicates 50W, 40 ft, 3 dB gain. However, findu shows you close to the river, so I'm guessing you're probably pretty low. Maybe you're not toooooooo far in the woods but tooooooo far down in a hole?

A friend just got one, and I'm trying to help him set it up.
Everything looks fine, 144.39 on the left, data on band A, TX every 3 mins, no rpt offset etc, but it's not transmitting.

The radio's up and running, he's using the right (b) side for voice on 440.

What sorts of non-obvious things can you get wrong on this?

Rendered body type: text/plain

All,

If you're in need of a small mag-mount active GPS antenna, the following item is listed on eBay for $24.95:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1940132100

The cable has a male MMCX connector which is a little odd, but it can be easily removed and replaced with a BNC (or whatever you need).

1) Is the radio in the standalone "APRS" mode rather than the bare TNC "PACKET" mode (I assume you are using the D700 standalone and not with a program on a PC).
2) Is GPS data getting into the radio? (i.e. is the word "GPS" on the lcd display flashing? Contrary to amost every other GPS-using device, the Kenwood's GPS indicator flashes when everything is OK, and lights up solid if no GPS data is getting through.
3) If the radio is set to use a GPS (not hand-entered lat/long data), it won't beacon at all until a valid GPS data stream WITH GOOD FIXES is being received.

```
4)  The beacon mode must be
     a: selected   ( There are three modes of packet transmission: Auto
beaconing every x mins, Mic-E burst on mic unkey, and manually triggered)
            and
     b: turned on (This is a separate menu option)

Not neccessarily...  What about HF?  I have recently been playing around with
a Tigertronics TigerTrak on 300 bd 30M HF mobile connected to my FT-100 and
ATAS-100.  A couple of nights ago while driving around Pasadena, CA,  findu
showed my point of initial entry into the APRS network was Chicago on one
transmission and Denver on the next!     I think we need some means for
tagging HF originated packets  as they enter the Internet stream (or get
gated onto VHF) so they can be ignored in this mode.

Be sure that:

1. If using a GPS, that it is set up to use in in the menu
2. If not using a GSP, that it isn't set up
3. Beacon is turned on or that you have otherwise triggered the position report
4. That the squelch setting is set properly

BTW, the right VFO can do either VHF or UHF with this configuration.

It wont transmiot until it has a position to transmit.

Hit the POS button and enter one.......

```
Also, These are the not-s0-obviuos D700 APRS settings:

1) set RADIO DISPLAY MODE 3 so that the APRS buttons are always
displayed

2) Turn UP the vollume on band A 144.39 and set CTCSS tone 100.

This lets you derive in Peace and Quiet all the time, BUT anyone anytime
can call you by voice on 144.39 PL 100 and get your attention.  ALSO, if
another D700 passes within say 5 miles of you, you may hear his packet.
Nice to know when you have a neighbor to play with...

We call this APRS VOICE ALERT.  When you callsomeon on 144.39 PL 100
always say "VOICE ALERT" so that he konws that he heard you on BAND-A.
Otherwise, he just thinks you are anoter voice op on his band B...

This is a very good point.
The only thing I can think of is that we will have to maintain a LIST on
FINDU of HF Gateways so that when a signal comes in that way, that it is
understood to be HF.

AH, but HG IGates like the KAM using the PATH of GATE, do not do callsign
substitution, so the PATH of GATE* should be in the packet, so the FINDU
vicinity tracking algorithm would ignore those entries.

Would that work?

It is not necessary for the algorithm I'm using. The different entry points did
not occur in the third callsign position:

WA8LMF>APTIGR,GATE*,WIDE2,qAS,WX6SGX:!3409.46N/11807.68W> TigerTrak HF Mobile!

It is only the third callsign in the path that is checked...since callsign
substitution is not performed on the GATE alias, this will not be a problem.

I think it is important that any attempt at determining position based on digi
be confined to that first digi position (third overall), errors would escalate
greatly after the first hop. In the above case, the first real callsign in the
path is WX6SGX, after the packet went through a GATE and two VHF digis.

Steve K4HG

Note that this includes messaging. If you have GPS set to NMEA and no GPS
connected, the radio will not transmit status, message or possition packets,
period. It will transmit acks to received messages though...

What about an HF-monitoring TNC igating directly to the Internet; i.e. not
retransmitting (GATEing) through a dual-port TNC ? One might shorten the HF
path to nothing at all if you assume you can get igated directly off the air

on 30M.

I have done this myself with a Kenwood TS-690 and the MixW packet softmodem
directly driving APRSplus connected to my cable modem.

In the HF mobile, I have tried no path at all, and still get to the Internet
via setups apparently like mine. The telltale GATE would not be in the path.

>
```

Still not a problem, the packet would look like:

```
K4HG-8>APRS,qAC,IGATECALL:....
```

So the vicinity position has only a q in it, again not something that would
return a posit...

WOW! AN-"ID"-DIGIPEATER-SNIFFER! Just what we need!

Just run that routine a few days and keep statistics on all the DIGIpeaters with LOTS of hits that are more than say 120 miles from the originator, and bingo, it is probably a DIGI with UIFLOOD "ID" set, (or good DX).

Then publish the list so that we will know which WIDEn-N digis are still set to "ID". Then we can update the DIGI's OVELARY.POS file so that even if we cnnot get the digi owners to mark their "ID" digis with the "I" overlay, then at least we can update the DIGIS.POS file so traveling users can use that to know what to expect in an area...

The tricky part is knowing the threshold between a packet that is probably local and one that probably went through a "ID" digipeater. Here would be an EASY way to do that. If the LONG of the digi was less than 100 deg W then use 75 miles or so (East coast flat-landers). If west of 100W then say 150 miles? I donno what ranges they get out there with the mountains..

535. [aprssig] Beacon errors!

From: Steve Dimse <k4hg@tapr.org>
Date: Sat, 23 Nov 2002 11:42:30 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-108312-2002.11.23-11.27.05--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

While looking at the vicinity data, I noticed something interesting. A lot of the large values are being caused by digis without positions in the findU database. Looking at the raw packets, there is a frequent theme, the E or W following the longitude, and before the icon char (usually #). I'm guessing this is like the aprsd problem, where a sample config file had an error (in the aprsd case, using the underscore as the icon) and this erroneous sample was used over and over as a template.

So, if you have a digi, look on findU to verify there is a good position. If not, go over the beacon character by character. If you are certain there is not a problem, email me with the callsign, as it is always possible there is a bug in my code. Looking at the data through another program may give a good posit, as some parsers make assumptions (like unless there is an E at that character, assume it is west...which works for most APRS users). I've tried to write my parser to follow the APRS spec as closely as possible.

I added an error message to my parser to print out unparsed posits, here are the problems I've found so far:

Missing E/W:

WV0T-9
K9HGX
WC2AES-11

Other beacon problems:
W4DUF-1
EA5DVS-14
HECA
CT1EJC
PD0SBH-2
NORTH
PU2UGK-15
F6CNB
K2LCA
SV2CLJ-11
W0NWS-3
KF4LQQ

Howdy,

+ Does anyone know what affect different datums has on a position report ?
+ The signal is received from the GPS and decoded.
+ And then is the DATUM applied ?
+ I am curious
+ Maybe I have it wrong ?
+ If you set a different DATUM does your position move by xx ?
+ Has anyone tested this ? I plan to shortly

Andrew VK4TEC

I tested this out ... unintentionally.  We used APRS in the local Santa
Claus parade last weekend.  3 GPS's  were set for their default WGS84 datum
while the 4th was set to the datum that should be used for central Canada.
(I can't recall the name)  The end result was that the position reported by
the 4th GPS about 500 feet NE of where the other three read.

I'm not sure of the exact mechanics of how the datum is used  in the
calculation, but I know the end result.

Sorry for the long links, but here are two good discussions of map datums. From what I've learned from Gerry, it is VERY difficult to just "convert" waypoint positions mathematically from one datum to another to derive an "exact" position. This only scratches the surface of this very intricate problem. Suffice to say that you should use the correct datum for the area you are navigating and everyone should be using a common datum regardless (when exchanging data or working the same problem...). Otherwise, your chances of deriving a meaningful position between two measurements from GPS set to different datums will be nearly impossible.

http://www.ask.com/main/metaAnswer.asp?t=ai&s=a&MetaEngine=directhit&en=te&eo=3&o=0&frames=True&url=http%3A%2F%2Fwww%2Egpswaypoints%2Eco%2Eza%2FFAQ%5Fbasic%2Ehtm&ac=4&adcat=trvl&pt=General+FAQs&dm=http%3A%2F%2Fwww%2Egpswaypoints%2Eco%2Eza%2FFAQ%5Fbasic%2Ehtm&io=0&qid=C6C0CC265230CE4282C20C7928D75113&back=ask%3Dwhat%2Bis%2Ba%2Bmap%2Bdatum%26o%3D0%26x%3D19%26y%3D11&ask=what+is+a+map+datum&dt=021123191909&amt=

And about halfway down the page, "What is a map datum"? is discussed here:
http://www.ask.com/main/metaAnswer.asp?t=ai&s=a&MetaEngine=directhit&en=te&eo=3&o=0&frames=True&url=http%3A%2F%2Fwww%2Egpswaypoints%2Eco%2Eza%2FFAQ%5Fbasic%2Ehtm&ac=4&adcat=trvl&pt=General+FAQs&dm=http%3A%2F%2Fwww%2Egpswaypoints%2Eco%2Eza%2FFAQ%5Fbasic%2Ehtm&io=0&qid=C6C0CC265230CE4282C20C7928D75113&back=ask%3Dwhat%2Bis%2Ba%2Bmap%2Bdatum%26o%3D0%26x%3D19%26y%3D11&ask=what+is+a+map+datum&dt=021123191909&amt=

If these links don't work, go to www.askjeeves.com and enter "what is a map datum".

That's putting it mildly! Gerry starts talking about this stuff in detail and I get lost pretty quickly!

For APRS purposes, the GPS should be set to WGS84. For other purposes, it should be set to the datum of the map you're currently using.

Across our county in WA, the difference between NAD27 and WGS84/NAD83 is between about 90 and 105 meters. That's quite a bit. It changes quite a bit for different areas of the world. Gerry also mentioned something about a subjective vs. objective datum. That might be part of why the difference varies wildy in different places.

For Garmin GPS'es, changing the datum DOES change the lat/long coming out of your GPS on the serial line. Garmin also puts out a sentence telling what datum you're currently using, but I don't think any software currently uses this to tweak your position to the map datum the software wants to use. It's important to keep it on WGS84 when using APRS for this reason.

G'Day

There are people that will disaggree with me, but here in Oz you should use the new GDA94, or WGS84. These are within mm of each other for most of the world.

Many people down here are suggesting that AGD66 should be used so that some older maps show up correctly. Australia as a nation has decided to phase out AGD66 and mode to GDA94, by the year 2000.

AGD and GDA are out by about 200m, but that varies with Lat and Long. I know that near Bondi Beack there are hams living with large towers at the same Lat/Long, just different datun.

So use GDA94, or WGS84, and make sure everyone else does too. I personally use WGS84, but it does not matter which of the two. And if someone tries to tell you that your GPS is wrong, then they are wrong.

I have included some Q&A from the GDA WWW Site.

Why is Australia adopting the GDA?
It is becoming increasingly inefficient to work with AGD coordinates in an international environment where positioning, navigation and information systems relate to a global Earth model. The use of a globally compatible coordinate system is inevitable and the longer it is left, the more difficult and expensive it will be to convert.

Why can't we continue with AGD and just transform coordinates as required?
Because of the convenience and efficiency, large organisations will ignore AGD and use global coordinates anyway. Many international organisations are already committed to a geocentric coordinate system, and the equivalent Australian organisations are following this user demand (e.g. Civil Aviation Authority, Dept of Defence). It is therefore sensible to provide the framework for this inevitable change to occur smoothly and economically and without fragmentation of Australia's coordinate system.

Do I have to change to GDA?
You don't have to change to GDA. As always, individual authorities will be able to work with project based coordinates (AGD or whatever). However, as other authorities change to GDA, it will be increasingly inefficient to integrate these projects with other data sets.

How will 'continental drift' affect GDA?
The Australian plate is known to be moving in a north easterly direction at a rate of about 6 cm per year, but there is little known distortion within the plate. This means that continental drift will have no real effect on relative GDA positions, but over time the absolute position of all points will change by a similar amount.

Those seeking accurate positions from GPS work with differential positions and will not detect any change in absolute position. With current technology the best absolute position that can be obtained by routine means is about 20 metres. This means that it would take about 300 years before the change could be detected.

Assuming that rapid advancement and availability of technology allowed absolute positions to be determined at the 1 metre level, it would still be 15 - 20 years before the change could be detected. At this time transformation parameters could be derived allowing the few who needed to, to update their absolute position.

Will zero degrees longitude still pass through Greenwich?
Yes, zero degrees longitude will still pass through Greenwich because this is part of the definition of the coordinate system used by GDA.

As mentioned before have been trying to work out bugs with running Aprs using the Sprint Merlin C210 air card. Hopefully we have found why the air card will only operate for a couple of hours then die! Yesterday we drove the usual 1 plus to the "big city" that being Ashville, NC. Was looking for more ram for my anchient (1996) Gateway Solo 9100 laptop. There isn't a Comp USA but there is a Gateway store. Was hoping they would at least provide some info and where to purchase the ram. gateway has changed a bit...they now carry some stock. When I bought my 9100 it was listed at $4500 but I bought it refurbished, after the orginal owner returned it within 3 weeks, for $2300. It had been running Aprs almost continuosly 24/7/365 until I sold the truck May 1999. You see I am trying to justifiy what I am about to inform you about. While I was getting the info my friend was window shopping. I can't believe how much the prices have dropped for laptops. Well JOe asked to look at the Gateway 1450 with lots of ram, of course, 1.13 gig processor, 30 gig HD, floppy, USB, PCMCIA, 16X CD-RW, maybe it was fater than 16X, DVD, 15 inch screen that I can see from all angles very nicely, Windows XP Home, in a black box! And it isn't even modular so all these things are in place in the black box al the time ready for use. I think it was $999 but there was an immediate rebate that the salesman didn't even know about until he rang it up...anyway the totally with tax out the door was $957. Now maybe I am way out of tune but I think I got a lot of reliable machine and service for a very reasonable price. But the best part is that it is for you all! Well at least I hope this resolves the problems. So far it appears that way. It is a little frustrating going for Win 98SE to XP Home but that'll get better with time.

Although I won't be xmitting on the ham band at least I won't be on a wire and will still be sending my posits via RF...at 1.9 gHz! But as I promised I will be back on HF/VHF (ham bands) on Aprs just as I used to be probably within 6 months. The new laptop has delayed me about many days of that 6 months saving for somewhere between $25-40K down stroke for the new truck. It'll then take about 30 days for the truck to be built and about 8 weeks for the sleeper to be built and mounted.

Another reminder...remember that the air card it depending on the Sprint network to be there! Sprint says they cover "nearly" all the Interstate highways! Yeah right! I know of about 50 miles on I40 east of Albuquerque that there is no network! So if I odn't carry on a get to using my gift to gab (even with my fingers) as I am doing right now then if you lose me on Aprs it is because of Sprint and not the hardware or software! Be patient and hopefully I'll pop back on the screen. Presently I am home in the mountains of western NC and there is no Sprint network nearby. Later today (Sunday 11/24/02), probably mid afternoon, I'll be on my way to Charlotte. I am going to go 30 mile out of my way to stay on the Interstate system hoping that Sprint will be there all the way. Watch for me and if you light let me know if it worked out okay. I'll stop a couple of time to check it out. I did receive the power/data cable yestersay for the GPS. Surpising enough I only made one battery change from Chicago to Atlanta to here with the Garmin Sport Track.

Enough already!
Peter

Rendered body type: text/plain

APRSdom,

We are trying to get a handle on how the national APRS

system is working and how it can best serve users.
We need some feedback.

The following digis have reported mobiles and position reports DIRECT from over 150 miles away. The number of such hits are shown. K4HG made this list from 5 hours of data capure from FINDU.COM of all packet paths in the format of:

FROM>TOCALL,DIGIx,........

and then comparing the posit of the FROM call to the DIGIx. Hopefully the first digi is where the packet was first heard.

The assumption is that these anomolous reports are either
1) DX packets
2) the DIGIx has "ID" set and is overwriting the source data
3) or some digipeaters may be doing pre-emptive digipeating.

The "ID" digipeaters always overwrite the first digi of a path with their own call, thus losing the originators path data and undermining the performacne of the national network.

But because of these ambiguities this data interpretation could be wrong. We need your help to validate this list.

If you can hear any of these digis DIRECT, you can easily confirm if they have ID set or not by sending a packet with only the path of "WIDE3-3" (the 3 is not important). If the packet comes back in the form of DIGIx,WIDE3-x then the DIGIx is an ID digi, and we need to know that so we can tell where the national APRS network is broken.

This list is sorted from WEST to EAST in Longitude, so it should be easy to find your local digi, do the test, and report privately to me and I will clean up the list.

Thanks!

Bob,

The other possibility is that some of these digipeaters are located on high mountaintops, with large areas visible to them. I know that the N7ZEV digi here in the Las Vegas area is atop an 8000' mountain, and can hear from Barstow, California to St. George, Utah along Interstate 15.

G'Day All

Thank you for reading this message. TAPR provides this mailing list
along with others as a service to their members and the Ham Radio
community in general. Providing this service and other services such as
our FTP site and the cost of developing new products like the Pic-E and
EasyTrak, costs money.

We are more than happy to provide these resources to the entire Ham
Radio community, but we do ask that you do concider joining TAPR. A good
way to see what we're up to is to take a look at the latest issue of our
quarterly journal, the  _Packet_Status_Register_ which is available for
download at
http://www.tapr.org/PSR

Membership in TAPR is only US$20 regardless of whether you live in
Tuscon, Arizona, or Sydney, Australia. If you want to join, or if your
membership is coming up for renewal, please visit www.tapr.org on the
Web for details. Specifically you can go to the following page for
information
        http://www.tapr.org/tapr/html/Fmembership.html

Darryl Smith, VK2TDS
TAPR Board Member

P.S. I have recently joined the board as its first non-North American
board member. As part of my Board duties, I have agreed to have overall
responsibility for membership. If anyone has any questions or concerns
about membership or TAPR in general, please EMAIL me. I can also be
contacted by phone with prior arrangement

```
In the APRS menu, you need to set the time and maybe date in the TNC and
activate the TNC for APRS on powerup.

546. [aprssig] Palm M105 Question

From: "James" <kb7tbt@qsl.net>
Date: Sun, 24 Nov 2002 16:26:27 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-108464-2002.11.24-18.12.07--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi Folks!

I have a Palm M105, I have installed the pocketAPRS on it and a Phoenix map.

I assume that this is the setup I need. It does work so far I think, don't
see the map yet.

My main question is what do I need to setup a GPS/TNC with the 105 and do I
need to use the hot sync cradle or is there another cord that will interface
with it?

Is there a way to power the unit without soldering wires on the Batt
Terminals?

I am currently running a KPC3+ on a Yaesu 2600, WinAPRS on a p166 junk
computer at the house. No GPS required.

Rendered body type: text/plain

All:

I've been getting a bunch of objects such as "02305851" or "02301638"
with an "H2O" symbol from WE7U.

What do these symbols represent? I notice a bunch of them around my home
county of Pinellas, FL.

73!
Chris N4BSA

Hi Chris,

You are connected to an APRSFIRENET server. FIRENET, although it includes
the APRS-IS, is a seperate network with much more data on it with the client
connectivity to/from the APRS-IS.
The H2O objects you are seeing are water gaging stations. You can see
gaging height (gh) and water flow (cfs). They normally are located on some
sort of water way, river, lake, dam, etc. They are normally operated by
some government entity like Corps of Eng., BOR, USGS, etc.
Any other questions you may have, I'd be happy to answer them off list at
jim@wa6oft.com .

73
Jim, WA6OFT

I was just browsing the net and came across the link for a neat little one
wire weather station, but it gets better, they have a Visor modual for the
weather station/ Nice way to have a sweet little aprs station that can do
weather and aprs all in a neat paclage. Thought I would share the link:

550. [aprssig] NOSaprs 1.15b3 available - WIDE & WIDEn-N digipeating

From: Maiko Langelaar <maiko@langelaar.net>
Date: Tue, 19 Nov 2002 11:44:05 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-108498-2002.11.24-22.55.47--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Greetings,

Release 1.15b3 of NOSaprs is now available as a complete upgrade
kit (not a patch this time) from any previous release of NOSaprs
for JNOS and TNOS.

I have also added fresh new DOS and Linux binaries (executables)
of JNOS (version 111f) that have NOSaprs 1.15b3 compiled in.

This latest release will let JNOS or TNOS do WIDE or WIDEn-N
digipeating just like a real APRS digipeater. I have code in
place to check for duplicate frames to avoid the situation of
WIDEn-N frames bouncing back and forth endlessly between NOS
and other digipeaters on frequency.

Note : Feedback is welcome. This is still ** EXPERIMENTAL **

Please MAKE SURE you read the release history notes for the
above new feature as well as other enhancements and fixes.

The website is as follows :

   http://www.qsl.net/ve4klm/packet/aprss.html

Best regards,

Maiko Langelaar / VE4KLM

551. [aprssig] Another low-cost ($114 US) GPS device suitable for trackers, D700, etc.

From: WA8LMF2@aol.com
Date: Wed, 20 Nov 2002 06:49:13 EST
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-108500-2002.11.24-22.56.24--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
I have mentioned, on this list,  in the past the Tri-M Systems Smart
Skymaster combination GPS Patch Antennna and 12-Channel Receiver.

[ New low price and order info after recap of my previous post for the
benefit of those that missed my original info. ]

This unit is packaged in a 2" diameter, 5/8" high white plastic package
similar to the standard antenna-only round GPS patches.
     A coarsely-threaded 3/4" hollow steel stud about a 1/2 inch long sticks
```

out of the bottom. You drill or punch a 3/4-inch hole in the vehicle roof or deck lid, insert the unit from the top and spin a matching plastic wingnut onto the stud from the bottom.

An 8-pin mini-DIN cable with a right-angle plug (same connector used on Macintosh serial ports) plugs into a female DIN socket in the center of the stud. The total clearance required under the mounting surface is about 1".

The other end of the 8-foot cable has the usual 9-pin DIN plug (for PC serial port data) and PS/2 plug (to tap 5VDC from a laptop's ext keyboard connector). The 8-pin connector in the receiver has a pin with a 1 PPS TTL timing output, but the cable assembly doesn't carrry it to the DB9 -- you would have to make your own cable by cutting up a Mac serial cord.

A cigarette-lighter plug with integral 5VDC-out switching regulator is included to power the unit if you don't want to use a laptop. This regulator caused massive RFI to the standard AM broadcast band and the 160/80M ham bands so I replaced it with another switcher I packaged in a heavily-shielded die-cast box.

I made a mag-mount adapter for this device by punching a 3/4" hole in the top of the cap from a Right Guard spray can, mounting the Skymaster on it and then gluing some magnetic rubber gasket material to the bottom with silicon rubber adhesive.

The unit automatically starts outputting $GPGGA, $GPRMC, $GPGSV, $GPVTG, $GPLL, and $GPGSA strings at 4800-8-N-1 when powered up. I have had one hard-mounted on my Passat running continuously 24/7 for over a year now with excellent results. It simultaneously feeds my D700, laptop and a TigerTrak tracker. The 12 VDC drain with an 85%-efficient switching supply is about 70mA.

Having the antenna AND receiver roof-mounted has a considerable advantage. When the receiver is remotely located, the antenna must have a high-gain preamp in it to offset the astronomical coax loss, at 1600MHz, of the RG-58 or smaller cable typically used to connect remote GPS ants to receivers. These 15-20dB gain amps, are located directly behind low-Q broadband (not-frequency selective!) patch antennas. They easily overload, desense and go out of lock when you pass within a half-mile or so of the ever-increasing number of 1.9GHz PCS cell sites in urban areas. [Or if you frequent mountain tops with 2GHz microwave systems on them as I do!]

In the past, I was amazed to see that cheap "mouse-type" GPS units (such as the Delormes, Rand McNally, Pharos, etc) sitting on my dashboard inside the windshield actually remained in lock far better than a more expensive unit with remote external antenna. The common characteristic of all these units is that they use a PASSIVE antenna connected directly to the receiver front end with essentially zero feedline. With no active electronics in the antenna, they are far more immune to PCS overload.

This device is manufactured (or is it imported from Taiwan??) by Tri-M Engineering at:
http://www.tri-m.com/products/systems/smartskymaster.html

Quoting from the Prairie Geomatics website (their Canadian distributer located in Manitoba, CA) at:
http://www.prairie.mb.ca/tri-m.htm :
"Not just an antenna... but a 12 parallel GPS and antenna in one small, roof-mountable enclosure. Perfect for vehicle/motorhome use with a laptop running any of the readily available mapping programs. Power can be supplied by the included cigarette lighter plug or from the PS2 port of a laptop
NEW PRODUCT - NEW LOW PRICE ---> $114 US <--- $185 CDN"

Remember that with NAFTA, there is now no tarrif or hassle ordering stuff from Canadian dealers from US addresses.

The Datum is the origin of measure of the system used to ascertain position. If you're going to measure something on the Earth, first you have to identify the system you're working in. This includes a point of origin, determination of the smooth shape of the earth, a coordinate system in which everything is measured, and the units of measure involved. If you're really esoteric, you'll also mention whether yours is a static (no accounting for tectonic motion, continental drift or solid earth tides) or dynamic (one or more are accounted for and periodic adjustments adopted).

A Datum is adopted to satisfy a local best-fit requirement. So, similarly, is an ellipsoid. Thus, datum and ellipsoid are inextricably linked.

The GPS Datum uses the World Geodetic System of 1984, a dynamic datum that incorporates the GRS-1980 ellipsoid as its core reference to the ellipsoidal shape of the Earth. It should be noted that the Earth is, for all intents and purposes, a sphere (some geomaticists and geodesists prefer the term 'spheroid' to that of 'ellipsoid' as a result). If the earth were viewed on a scale where it were the size of a billiard ball, it would, in fact, be a more perfect sphere than that ball is today. However, at the scale we look at it, we consider that in order to model the earth as a smooth surface, we must account for the fact that its equatorial radius is 6,378,137 meters, and a polar radius of 6356752 meters, for an eccentricity of 0.9966. Or, pretty close to a real sphere. WGS84 is "adjusted" mathematically about every 2 years to correct for continental and tectonic motion.

WGS84/GRS80 are a "best-fit" worldwide, and their periodic adjustment is meant to keep things in balance. It's a compromise, but one of the best, mathematically, to date.

(End Part 1)

Rendered body type: text/plain

CAUTION: Technical Content Follows. Read at your own peril...

Continuing the discourse on Datums and Ellipsoids:

In the Continental US, Canada, Mexico or Latin America, one might also choose NAD83. Since NAD83 also uses GRS-80 for an ellipsoid and had similar assumptions on coordinate system and metrics. It's not adjusted as often as WGS84, but is still only centimeters different from WGS84 in precise measurement. Surveyors in the US use NAD83, as adjusted in 1999 and released to the public in 2000, for all formal work requiring reference to the National Spatial Data Infrastructure.

NAD83/GRS80 is the "best-fit" combination for the Continental US, and was designed with the intent of incorporating Canada and Central America. It's less than stellar, however, in Alaska, Hawaii and Puerto Rico.

On the other hand, if they were to use the North American Datum of 1927, and attempt to reference it using GPS, the results could be somewhat inaccurate, with varying accuracies in different parts of the US, and, if referenced outside the US, the best (and most hopeful) description of the results would have to be "Interesting." NAD27 had a somewhat checkered past, including our Congress decreeing the coordinates of some observation points used in the original adjustment, the fact that the instrumentation was crude by today's standards, and that all calculations were performed by hand.

NAD27 was "the best available at the time," but probably never really qualified as a "best-fit" datum model because of the long baselines, incomplete closure loops and subjective nature of some observations. The Clarke 1866 ellipsoid, however, was an excellent piece of mathematical legerdemaine. While its end result was pretty darned good, its derivation was somewhat interesting, but that's a different story.

Almost every country has devised their own national datum. The Soviet union, with Pulkovo 1942, not only had a national datum for thier geodesy and mapping, but made it a State Secret. Even today, it's hard to get ahold of. And, since it made no reference to other systems in widespread use at the time, it doesn't tie well to other schemes.

The British used the Ordinance Survey of Great Britain, 1936, and Airy 1830 Ellipsoid as their basis. This ellipsoid has a semimajor axis of 6,377,563.396 m and an index of flattening of 299.32496. Note that the equatorial radius is some different between Airey 1830 and GRS80.

OSGB 1936/Airey 1830 represents a better local fit than WGS84/GRS80 for the British Isles; thus that's what they use preferentially.

The short form answer is: There's a great deal of difference that may be seen when using different datums. It could be so small as to be almost indiscernable or large enough to make you think the cars are driving in the pasture land as much as a kilometer from the freeway THEY think they're on!...

Rendered body type: text/plain

Caution: Technical Content Follows

> + The signal is received from the GPS and decoded.
> + The signal is received from the GPS and decoded.
> + And then is the DATUM applied ?

Not usually. What the GPS receives is timing information. At least in the consumer grade receivers, that's what you get. The "Navigation Code" data are sent by the various satellites, and the receiver on the ground first finds a convenient satellite, the higher the better in its sky, and sync's its onboard, cheap, free-running quartz clock to the satellite's somewhat more stable rhubidium (primary) or cesium (backup) clock. Once sync'ed there's not much delta between the two, and within the error budget, the signals are as good as solidly locked.

The data from at least 4 satellites are received, incorporating the almanac data (rough satellite orbital data, satellite health/usability, tropospheric and ionospheric models, clock updates, maintenance schedules), the individual orbital (ephemeris) data for each satellite (and sent only by that satellite), and the navigation signal. The purpose of the navigation code is to allow the receiver to range itself to a single satellite. Once at least 4 satellites are visible, a 3D position fix can be achieved (3 satellites for 2D).

The process for position derivation is called trilateration. Unlike high school geometry where you thought in terms of a known distance between 2 stations, and fitting of position based on determining the angles between several stations (easier for the humans) in this case, you know where all the satellites are (recall, you got the ephemeris, and your GPS has a pretty decent CPU to propagate the ephemeris to "now") and you are getting distance from each satellite. This is somewhat harder to put into words than it is when I'm standing up in front of a class, can draw on the board, and wave my hands, but, knowing the position to one satellite places you on the surface of a virtual sphere at range 'n' from satellite 1, and surrouonding satellite 1. It tells you, really, nothing about a point or region on the Earth, at this time. When you've 2 satellite ranges, your position resides somewhere on the curvilinear pattern describing the surface intersections of the 2 spheres. Recall you're residing, now, on the surfaces somewhere of 2 spheres surrounding the 2 satellites you have good ranging on. And these spheres are diffing diameters. And moving. With a third satellite providing ranging data, you reside on the linear intersection of _3_ spheres, describing a 2D position within the limits of the error budget of the GPS system. Addition of data regarding a 4th satellite gets you a point position at the intersection of 4 spheres in virtual space, at a given epoch. Related back to the data concerning satellite orbits (ephemeris), one can then derive where one _WAS_ at the given epoch, in Earth Centered, Earth Fixed (ECEF) cartesian coordinates, with the X axis projecting from the centroid of mass of the Earth through the Greenwich, or Prime, Meridian (Longitude 0/360) at the equator (Latitude 0), the Y axis projecting from the centroid of mass of the Earth through the equator at Longitude +90 (EAST!), and the Z axis projecting from the centroid of mass of the Earth through the semimajor axis, or, the axis of rotation, nominally called the North Pole.

The various datums are related to ECEF coordinates, and from ECEF, can be converted via a multiparameter transformation to the datum of choice, with varying degrees of success... One can, for instance, convert TO NAD27 and back with a degree of aplumb. However, the mathematical relationship is not one where you can necessarily convert, starting with NAD27 coordinates to NAD83 or WGS84, and expect the same degree of resultant accuracy one could expect with WGS84-to-NAD83 conversion, or, NAD83-to-NAD27 and back. Subjective datums are like that.

> + I am curious

I like to see such curiosity about things like this!

> + Maybe I have it wrong ?
> + If you set a different DATUM does your position move by xx ?

Depends on the datum. Some transform cleanly, some do not, as I've indicated above.

> + Has anyone tested this ? I plan to shortly

Er, yes. Evaluations of datum transformation are standard in geodesy and geomatics classes.

Note: This doesn't even begin to discuss the difference between sea level height datums and orthometric height datums. That's a whole 'nother semester's lectures. And I've only skimmed the surface here.

From: bounce-aprssig-19956@lists.tapr.org
[mailto:bounce-aprssig-19956@lists.tapr.org]On Behalf Of Mike Yetsko
Sent: Wednesday, November 20, 2002 4:21 PM
To: TAPR APRS Special Interest Group
Subject: [aprssig] USB to Serial and Dallas Semi / AAG wx station...

A couple of quick questions...

First, I'm writing an application that use a weather station (just
pressure,
temp, and hum) and I want to try to use the roof top unit that used
to come from Dallas Semiconductor (the 1-Wire thing for use with
the T-238) as an 'aux' input for wind direction and speed. Not to
mention a second temp, and maybe add the rain bucket too.

Anyway, while I have two serial ports on my machine, I also use them
for other things.

One time, quite some time ago, I saw a 4-port serial hub that ran on
the USB. Is that still being made? Or is my best bet to just get a
4-port
USB hub and then put in USB-serial cables as needed?

The other question concerns the weather unit. For direct PC use, it
uses the serial to 1-wire converter. Are the RS-232 levels on a USB
to serial converter robust enough to then power a serial to 1-wire
converter to power the station? Anyone try this yet?

If not, I will have to try it... But I thought if maybe someone else
already
did they might give me some 'heads up'.

Oh, finally, I just ordered one of the weather units from AAG. Any
feedback, pro or con, on dealing with them and getting the product
from Mexico to here? I put the units on a credit card, but they only
accept "Pay Pal".

Mike

Thanks for the overview, I for one, appreciate it. I'm sure I've read all
that stuff before, but sometimes a refresher course is helpful.

About 4-5 years back I was backapacking in Arizona with some friends in an
area we had never hiked before and we were in a heavily wooded area where
the trail was faint and distant landmarks were not visible. I finally
found a marked spring and located in on the topo map I had bought of the
area just prior to the trip. I had been trying to match up this map and my
GPS for several hours and was having difficulty. The GPS and map were way
out of agreement and I thought it may be due to heavy tree cover. We
decided to take a break at the spring and I chose to figure why the map and
GPS were so out of whack... And then it hit me... DUH! The USGS topo
map is NAD27 and the GPS was set to WGS84. Although technically the
difference is supposed to be 64 meters east, I was seeing errors more like
250 to 300 meters...

4 to 5 years ago? The error was probably more due to SA plus wrong datum!

Steven thanks for the review sounds like a nice unit for a hassle free installation. The only thing I want to comment on is the overload and desense you mention from PCS sites. You may want to look into that further, I am a field engineer for a PCS company and we run the Motorola Oncore (old 6ch verison) at most of our sites (over 300+ just in South FL) using GPS antennas with 26db of gain for our XO and RB which is fed by the XO. The 6ch Oncores are not the best in the world but we still do not have any problems. I run a motorola patch antenna with preamp on my dash and sometimes a antennex model on my roof all day long and neither have problems with a GPS45 or a GPSIII while I am working.

The only problem that is serious is the 3rd harmonic of TV CH 67 falling in the GPS band. Here is a real big one! We had to upgrade our XO to a model with a newer version of the Oncore (12ch RX)so we could get a lock at these sites. I have one other site with a FM Broadcast transmitter that has a spur (legal in level) but also co-located that falls in the GPS band and we needed a upgraded Oncore to work there also.

With CH67 even the new model oncore would have problems and we needed to move about 150ft off site and angle the antenna to
the horizon to avoid the overload from the TV antenna. All sorts of lab quality antennas were tested from MicroPulse (not cheap) and they helped but did not solve the issue untill we upgraded the GPS and eventually moved the

```
antenna far away and mounted it behind a 18ft dish for shielding.

Rich K4GPS

SNIP>>
Having the antenna AND receiver roof-mounted has a considerable advantage.
When the receiver is remotely located, the antenna must have a high-gain
preamp in it to offset the astronomical coax loss, at 1600MHz, of the RG-58
or smaller cable typically used to connect remote GPS ants to receivers.
These 15-20dB gain amps,  are located directly behind low-Q broadband
(not-frequency selective!) patch antennas. They easily overload, desense and
go out of lock when you pass within a half-mile or so of the ever-increasing
number of 1.9GHz PCS cell sites in urban areas. [ Or if you frequent
mountain
tops with 2GHz microwave systems on them as I do! ]

I'll second that as well.  I visit 1.9Ghz gsm and pcs sites everyday and my
Garmin GPSIII with external amplified antenna has never had a problem.  We
use gps to sync our paging transmitters as well.

You need to all use the same datum, preferably the datum used by the chart you are using. Ran into this
 problem taking data in Panama some years ago, enlightening!
 Ray McKnight - WB3ABN <shortsheep@worldnet.att.net> wrote:Sorry for the long links, but here are two
good discussions of map
datums. From what I've learned from Gerry, it is VERY difficult to just
"convert" waypoint positions mathematically from one datum to another to
derive an "exact" position. This only scratches the surface of this
very intricate problem. Suffice to say that you should use the correct
datum for the area you are navigating and everyone should be using a
common datum regardless (when exchanging data or working the same
problem...). Otherwise, your chances of deriving a meaningful position
between two measurements from GPS set to different datums will be nearly
impossible.

I have 2 APRS mobile stations. The one with Tiny Trac II does not show
up on my other mobile unit which is a Kenwoood TH-D-7 and a handheld
Jornada running APRS-CE. (The Jornada is back dated to allow the one and
only APRS -CE beta version to run).
The Tiny Track II does show up on Findu.com no problem but will not
show on the screen of my other mobile even if its parked side by side in the
garage. It only appears if it is digipeated on another digipeater (which is
down right now).   What do I have set up wrong?

I don't believe this is an acceptable practice.  Such activity can
render an RF network useless.  I would think that sending NWS
bulletins and MAYBE a few packets of local interest out to the RF
would be useful, but unless you are without any adjacent
infrastructure to support packets coming in from neighboring areas
you would not want to send everything out to RF.

Just my two cents worth...

73s,
Eric KF4OTN

NO...in fact it is very bad practice, unless you live in an area with nearly
0 activity...further, there is no way to gate every packet received from
inet to RF...the bandwidth isn't there at 1200 baud. So...he may not be
doing everything (in fact he can't), but he may be doing way more than
necessary or courteous.
```

In our area we gate to RF the appropriate NWS warnings and baloon experiments and that's about it. We do add individual local stations who are going on long trips. They are added for a few days to a week and then taken back off.

Don't think it is common or accepted. I would also be surprised though if it is really all Indiana stations since all indiana stations might just max out the local 1200 baud channel. I run an Igate on the IN/IL state line what confused me initially was seeing my gate transmit packets destined for stations some 90-100 miles away. These turned out to be station to station messages and were going out because I was less than a certain number of hops from the destination. Is the traffic you are seeing limited to messaging traffic or are there position packets as well? You are close enough to Indy he may be suffering from an even worse version of what I see on my Igate occasionally, that is forwarding messaging packets to RF.

Your email address 'lyris.aprssig@tapr.org' has been submitted to be
unsubscribed from the 'aprssig' mailing list.

This unsubscribe command requires your confirmation that you want to be
unsubscribed.

To confirm that you do want to unsubscribe, reply to this message so that
the words "ok 842" appear somewhere on the subject line.

Make sure that your reply message is addressed to
unsubscribe-confirm@lists.tapr.org

You will receive notification that your confirmation has been received, and
that you have been unsubscribed.

If you do not want to unsubscribe, do nothing. You will be kept on the
mailing list.

Practically all the packets he's transmitting are postion packets. After
looking closely at my digi-path list it appears he's transmitting only 9th
district calls, regardless of where they are, and using a path of WIDE2-2.
(I'm assuming the gating station inserts the unproto path, correct?).

Oregon Scientific sells a hand-held SAME capable receiver in that price
range. I have one and like it. It also has a dual-setting alarm clock (with
```

a snooze feature yet!) that has come in handy a few times. It's their
model WR-102. I wonder if RS is selling the same thing with their name on it?

Announcing WAPaprs:

For the past few months I have been working on a new APRS application, WAPaprs. It allows you to access APRS data via a cell phone. Think of it as a findu or aprsworld web page, but formatted for the limitations of a cell phone.

I am looking for beta testers. You "must" have a web enabled cell phone. For more information look at the WAPaprs web page. Contact me if you wish to provide feedback on WAPaprs. Enjoy!

Am presently at home where there is no Sprint footprint, however I am not even going to move that truck until I have too! Hi hi!

It appears we may have found a conflict with the XP's comport setup. Hopefully this will cure the on going and new problems after switching to a new laptop with XP. I might be on the road Friday and most certainly Saturday because I must be in Orlando by 8am Sunday to unload my portion of the 10 truck loads of the Chevrolet booth for the Orlando Auto Show. Gotta be there because "The show must go on"!

Let me explain 1 problem which can be taken care of with a certain loading sequence and see if anyone has ever seen this. If I turn on the Magellan SportTrack Map setup on comport 1 the boot the laptop it appears the GPS captures the mouse and every 1 second that the GPS puts out the cursor jumps out of control at random and opens various dialog boxes. When I turn the GPS off the mouse gets back its control and keeps it even after turning the GPS back on. So the sequence is simple but very curious! Seems it may be a BIOS problem best we can come up with.

If we can get the Sprint Novatel Merlin C201 to work properly on Aprs I will then consider a web cam sitting on the co-drivers seat! One thing at a time though.

I don't plan to keep this truck much over 4 months so I am inclined not to install and RF ham equipment until I have received the new truck I intend to order. I want to give you the strong dependable RF signal I used to have and when doing a mobile installation it must be right. I probably wouldn't be to ambitious with the present truck.

73 - Peter

Nice. I'll be glad to stop dealing with compatibility problems with the few WAP
pages I've done on findU! I won't be doing anything more work on them, and will
pull them in a couple months when word of your system gets around...

I did not see the URL to directly enter one of the 6 options you list, is there
a way to do this? Mostly I want to see one particular page, no need to go
through an extra step.

I hope you do a page like radar-find soon, this is a most useful
feature...especially if it does a color->bw conversion for older cell phones.

On that topic, I made a test page for a user, and am told it works fine through
Sprint PCS (it does not work through ATT PocketNet). This is a regular HTML page
with a 150x150 section of the radar image centered on present position, and the
position report info seen on the WAP page. If this works on any provider other
than Sprint, let me know...

Steve K4HG

>
>Let me explain 1 problem which can be taken care of with a certain loading sequence and see if anyone
has ever seen this. If I turn on the Magellan SportTrack Map setup on comport 1 the boot the laptop it
appears the GPS captures the mouse and every 1 second that the GPS puts out the cursor jumps out of
control at random and opens various dialog boxes. When I turn the GPS off the mouse gets back its
control and keeps it even after turning the GPS back on. So the sequence is simple but very curious!
Seems it may be a BIOS problem best we can come up with.

I've seen this with a realemwin receiver. The system thinks it's a logitech mouse.  It's not bios, it's
OS/Driver.
You MAY be able to set it up as a device, then lock it out.

Yes, I use it daily and operate node #4680 in upstate NY. The software runs
on the same machine as aprsdALY igate. I speak frequently (and freely) to VK
land. There are nodes near you see
http://www.ipass.net/~jimprice/irlp/vkmap.html
Contact the node owners for permission, or set your own gateway up.

Georgetown, 30 miles north of Austin (actually the outer edge of the Austin area) has had
a big air show in May but that has now moved to Temple, 60 miles north of Austin. It is
scheduled for May 5th. The show typically attracts 12-15 thousand people and many planes.
The CAF will have several planes there and I assume will put on a show.

The area around the Georgetown airport has filled with Austin overflow and the newcomers
were complaining about the noise and danger of the show... Our area will be happy to
accept the tourist dollars.

I will be one of the volunteers helping put it on and hope that the Temple ARC will have a
station on at the airport.

Joe Dorn, W5VEX, Belton, Texas

I should expand a little more. I use it basically for voice communication,
it exhibits the typical traits of a voice link. I don't think anyone has
used if for anything higher speed than the SSTV mode. Bob B. has an outline
for invoking the IRLP nodes via a aprs terminal like cell technology, but I
don't think this has been successfully implemented yet.

I have been running my MFJ 1270C on 40m
packet for a while now.
I can't help but notice, that it is only capable
of driving my IC-706MKIIG to put out roughly 40W!,
while my PK-900 has NO trouble driving the full
100W out of it.
What's the problem with MFJ?

Why don't you try installing Linux and using Xastir.

Here's a link to a page of some-one who using a Linux and Sprint PCS via a USB cable to phone.

http://www.natecarlson.com/linux/sanyo-4900.php

The advantage of this setup is you aren't restricted by MB of download, just by the number of minutes of your plan (which is unlimited on weekends and nights).

If you're out in the country, but can't get DSL / Cable. This doesn't sound like a bad option to get decent bandwidth.

588. [aprssig] RadioShack -> Silent Key for HAM Radio

From: "James" <kb7tbt@qsl.net>
Date: Wed, 27 Nov 2002 21:03:52 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>

http://www.eham.net/articles/4317

RadioShack -> Silent Key for HAM Radio

Loren B. Cobb (KD7PLU) on November 27, 2002
Add a comment about this article!

After spending many, many dollars on IC Circuits, Resistors, Wire, Et al . . My the writing on the wall finally came clear when I asked some direct questions: 'You're out of Zeners and 2200uf Caps. When will they be re-stocked? And why don't you carry HAM stuff on the shelf anymore?'

I should have known when the HTX-252 went to 99 Dollars. Or when all the scanners were thrown under glass with big-red tags attached. But an open door revealed the 50 Ohm coax, packaged IC's and small transformers sitting in the back room collecting dust along with three full display panels of the like resting against the wall~ like tombstones of what used to be a Ham radio mecca.

'You got questions, we got blank stares . . .' This used to be the statement we all fondly remember after a trip to the shack. Now it's not so easy to live with. "We're not going to carry that stuff anymore. It's all been discontinued, and we'll probably start discounting it as closeout as soon as we have room."

No need to count the miles of register tape, but I'm positive my local RatShack has sold more loose components and parts to me alone to defend keeping the asile in-place and well-stocked! Now I'm thrown from the bus to make room for consumer electronics, cell phone accessories and DVD-VHS combo players! I'm mad. I feel my customer value and loyalty to the shop has been violated. They have taken a broadband selection of loyal patrons and spit them out like a watermelon seed on the sidewalk.

Why go back now? Catch a few deals? Hover over the 'bargin-bin of once loved, never-ending (Until now) flow of 8-pin dips and voltage reglators?! Why bother? Time to start going to national and other large, online electronic parts resellers that still know and love the considerable amount of money that hams pour into research, projects, PS & Amps . . even breadboards that do nothing but make good smoke-generators.

I'm sad to see what I feel is an end of an era. Another massive blow to our hobby, and a very clear indicator that the river of new hams will soon wither to a desert wash. We sat on our cans, we didn't go out and show-off the hobby, we didn't elmer the kid that asked if the HT was a scanner or phone. No- We just smirked and walked on. Too busy, to elite, too bothered by those who are green or un-aware of the complex, inter-workings of their own electronic world. We are the blame. The customers we could have programmed into buying things from our nook of the store are now going directly to the PILE of cheap RC-Cars and over-priced, plastic cell-phone covers with blue LEDs.

This infighting between old-school sparks and no-code techs; or the CW/No CW debate has got to end. We're standing by as 440 turns to liquid, our ATV channels are up for bid and everything above 800Mhz is a grab-bag for LD carriers to lay stake and slowly flood into our spectrum.

Go ahead and recon the sales coming up at your local shack. But do us all a favor- bring a young person with you. And when you get home, show them some very simple projects that will at least prime the well so we're not sitting on hill-tops using flashlights to communicate instead of radios in five years.

Well, I'll have to check with my local RS for the latest news.

The last time I visited RS, the electronic parts had been moved from pegboard to a large file-cabinet type storage / display system. But, this storage system was still in the showroom. The change made room for more VCR / CD / DVD accessories.

If RS does discontinue their parts business, it will really be a blow to APRS and other ham radio activities.

de Ken,
N5EQT

The last time I went to my local Radio Shack it looked more like Toys-R-Us than an electronics store. In July I asked about the new HT they were promoting in QST. They said they weren't getting any but did I want to buy one they would order it from the warehouse. I talked to the manager and told him I can't buy it if I wasn't physically able to look at it first. He explained that they weren't being sent any because they didn't sell enough ham equipment at this store. Figure that one out. How can you sell something you don't have. So he said he would order one from the warehouse for me to check out and if the warehouse had them in stock it would take about two weeks. So I told him to order one after he said they were on hand in the warehouse. I don't know where his warehouse is but they still haven't got any in the store. I'd have better luck asking Santa Claus.

Unless the corporate direction has changed, I think parts are, and will continue to be, a core ingredient of RS's 'anchor' business. For a RS corporate perspective, take a look at David Edmondson's speech he gave at the RS annual stockholder's meeting held in May of this year. David is President & Chief Operating Officer of Radio Shack. Here a small quote to interest you...."Let's begin at the top, and explore our anchor businesses . our Parts, Batteries and Accessories . and Wireless Communications businesses" He goes on to say..."First, Parts, Batteries and Accessories -- it's what we're most famous for, and why we're relevant."

The text of David's speech may be found at:
http://www.radioshackcorporation.com/pr/shareholders_DE_5-16-02.shtml

Perhaps this means there will not be a death-nail to the week-end drive to RS for parts for that new APRS tracker.

For the record, neither I, my family or close friends have a financial stake in Radio Shack. I just find annual stockholder speeches a good source of information....sometimes.

de Ken,

N5EQT

Having worked for a famous computer OEM, I can honestly say that what a company's management promises and a what that company does often seem to travel in different directions... :0 We used to get directives from middle management saying it came from the top, and in "skip-level" meetings the upper level management would deny they ever initiated such a directive. But the policy would remain in place (until the board of directors would intervene). How about a company that advertises "let us be YOUR IT Department" while at the same time outsourcing it's own IT and Telecom departments.

Another thing that I heard about Radio Shack from the top is that they will no longer badger you for your name and address when you buy a watch battery and an LED from the closeout bin and pay cash for it. Something about it not providing a positive shopping experience... Haven't people been complaining about that for close to 40 years now? I recall it being a topic of discussion in the late 1970's when my dinky hometown finally got a Radio Shack. They just get it now in almost 2003 that people don't like that.

Happy Thanksgiving,

Mark

Peter,

Every time I have seen this, I have ben able to go into the Device manager in XP and disable the "Serial Mouse" that mysteriously appears there when the serial device was plugged in. I found that deleting the device doesn't work, because XP just reinstalls it the next time around, but, when it is disabled, it does not reinstall.

Hope this helps,

Lou

Let me explain 1 problem which can be taken care of with a certain loading sequence and see if anyone has ever seen this. If I turn on the Magellan

```
SportTrack Map setup on comport 1 the boot the laptop it appears the GPS
captures the mouse and every 1 second that the GPS puts out the cursor
jumps out of control at random and opens various dialog boxes. When I turn
the GPS off the mouse gets back its control and keeps it even after
turning
the GPS back on. So the sequence is simple but very curious! Seems it may
be a BIOS problem best we can come up with.

```
Here in Ontario my Local Dealer is a close friend of mine.
Mostly they ARE getting out of the old core line of electronic
parts and widgets. Yes they still carry a bit but they are trying
to compete with Future Shop and Home Depot up here.

I have been picking up Garbage bags of IC's, Transistors, Resistors
and tons of other now discontinued stuff for $20 a bag.

To be truthful, unless I was desperate to finish a project or
do a running repair on some equipment I normally deal with
Mouser, Jameco and other mail order type suppliers do mainly
to the price of the Radio Shack devices.

The times they are a changin...

To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-108845-2002.11.28-10.12.27--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
I feel like I have nailed one foot to the floor and starting running.

I have been having problems with my KAM keying my FT-8100R - it won't.  In
an effort to remedy this, I tried resetting the KAM.  Now all I get is the
"PRESS (*) TO SET BAUD RATE" message.  When I press *, all that I get is a
repeat of the same with a lot of ASCII characters that I won't try to
duplicate here.

My terminal baud rate is 300.  I am at a loss - well, not really, the TNC
was given to me...

Any help?

Tnx es 73,

Joel Black, W4JBB

Hi Joel,

Try hitting only the asterisk several times until a "logon"
message shows up.. No RETURN key just asterisks..

```
All,
Will a KPC-9612 v3.0 firmware work as a stand-alone tracker? I'm asking
because I have one all set up, and the GPS connected but it doesn't seem to
be working. I have verified all the wiring, but it still doesn't work. The
TNC seems to be capable of acting as a stand-alone tracker, because when you
type DISPLAY G, it gives me all the GPS settings. Thanks!

Yes really. They may both lie, but stockholders have a perpensity to file
lawsuits against CEO's who do such a thing.

In other words, the CEO's are accountable to the stockholder's, they are not
accountable to the employee's. Business 101 like it or not.

Ladies and Gents!

Bill, KC9XG, has written a nice utility program for aiding the in the
installation of the States files for Pmaps.

If you are or are going to run Pmaps, it would be a good program to have.
And
it's FREE!

You can go to www.aprsfire.net and down at the bottom of the page, there is
a link to the file.

Rendered body type: text/plain

This script uses homeseer's voice text to speech abilities and reads the position of a station out to you relative to your local landmarks. If more than 5 miles from any of your local land marks, it uses a "large cities database". This is using www.aprsworld.net for source data. Note that it also ajusts the time to EST from CST.

This is pretty primative, but it works for my wife asking the PC where I am - and doesn't pull and maps from findu.
Wes

Increase Your Sexual Performance Right Now!
<http://ww%77.di%73c%6F%75n%74-ce%6Etra%6C%2D%6Ee%74%77%6F%72k.%63%6F%6D/5030>

Take control of your sex life, Order Viagra Online Now!

The drug Viagra is a revolutionary way to treat impotence and enhance any man's sex life.

To order online click here
<http://ww%77%2Ed%69%73c%6Fu%6E%74%2D%63ent%72al%2D%6E%65t%77or%6B.%63%6Fm/5030>

The drug Viagra is a revolutionary way to treat impotence and enhance any man's sex life.

It is a Safe and Effective way to increase a man's libido and has proven to be the most successful treatment for impotence.

No need to go through embarrassing, stressful situations anymore, you can now get Viagra from the comfort of your home!

Some Things to think about...

1) You will not get an erection without sexual stimulation - no need to be embarrassed like when you use other sexual stimulants. You will only gain an erection when you are sexually stimulated.

2) More men use and trust Viagra as a treatment for sexual dysfunction than other sexual stimulation aids. Viagra is a safe sexual treatment that is proven because of the wide use and acceptance by the general public.

3) When you use Viagra you are able to gain an erection through your partners sexual stimulation - all of your sexual acts, feelings and your love making is the result of your chemistry.

This is the easiest and most discreet way to
end impotence

To order online click here
<http://w%77w.%64i%73%63%6F%75%6E%74%2Dc%65nt%72%61%6C-%6Eetw%6F%72k.c%6F%6D/5030>

Rendered body type: text/plain

Hi,

I read about the MIC-E concept, quite interesting. But that presents a
problem, what is the best way of building a repeater site with multiple
APRS packet sources and internet gating?

Here is what I'd like to do:

- Voice repeater (IRLP node) listening for MIC-E packets
- 144.39 Digipeater
- Internet gating using aprsd
- Sat gating

Any suggestions on how to accomplish this all at the same site?

Thanks,
Adi

In a previous message I asked if anyone had a problem with XP while a GPS
was attached and the cursor would go wild!

Lou Ruh, WX3I, came up with the solution...FYI - After turning off the GPS
to get mouse control back Lou sugested going into the Device manager of the
system and would find an additional mouse. I disabled it instead of
deleting it and that solved the problem!

Thank you Lou!

Folks,

You know, sometimes we have only ourselves to blame ... case

in point; when was the last time you picked up a soldering
iron and actually built something ? (Probably close to the
last time that you dialed "0" and need help from the
telephone operator !) Which is why, saddly, both are
going off into history.

Radio Shack (Canada) is actually owned by the Tandy Corp.
(those fine folks that make those leather kits back in the
days of our youth) ... but they have a business to run,
and if there is no (little) interest in radio/electronic
parts, then there's no point in them putting these things
on their shelves to collect dust, and loose money.

Nope, sorry folks, but the "electronics/radio parts" part
of their business has gone the way of the big American car,
with rear wheel drive, and a big V-8 engine - well loved,
but gone forever into history.

You'll excuse me now, because my soldering iron is now hot,
and I have a DB-9 connector to put on a cable (out of stock
at Radio Shack) to go to a new TNC setup.

Um, I see a lot of new V8 (and V10!) RWD and 4WD vehicles in my neighborhood. They're called SUV's and they get worse gas mileage that many of the 60's muscle cars. I bet you there are more V8+ engines on the road today than there were 30 years ago. In the 1960's and 1970's more American passenger cars sold with 4 or 6 cylinder engines than V8's by far.

Lessee. New cars not including trucks V8/10 RWD - Ford Mustang, Lincoln LS, Lincoln Town car, Mercury Grand Marquis, Ford Crown Victoria, Corvette, Camaro (soon to be discontinued), Firebird/Trans Am, Dodge Viper... And I'm sure I missed several (Cadillacs). I won't even go into imports with V or W8/10/12 engines and RWD. I think Ford makes at least one FWD V8 car much like the old Tornado/Rivera/El Dorado. I have a friend with a mid-70's convertible Eldo that has a 513 cubic inch V8 (!) Not bad for Front Wheel Drive.

BTW, many of the current crop of V6 engines churn out more HP per cubic inch than V8's of old. Problem being they only have 2 bolt mains, with 4 main bearings and a 60 degree crankshaft splay angle (or thereabouts) on a narrow-deck. This puts a lot of stress on the bottom end of the engine... Every V6 failure I've seen is in the bottom end. And fail they do.

By the same token, I think small retail electronic component sales to hobbyists/students/businesses is probably about the same as it was 30 years ago. I think Radio Shack has driven away customers, and other retailers have stepped in. Ever walked into a Fry's Electronics? Ask people in Phoenix about Tri-Tek... Why would I go into RS for a component where I find poorly stocked parts bins and I'm harangued for my name and address; and told what I'm doing is "uh-legal" by a pimply-faced 16-year-old RS clerk? I can go to a place like Tri-Tek, find the parts that I need, pay less than RS, and deal with a friendly person who actually knows something about electronics.

It's a no-brainer. Vote with your feet and your wallet. Granted, I now live in a city with no alternative to RS in many cases, but I'm gonna be mail-ordering the components anyway, because the 3 local Radio Shacks in

Sioux Falls may list a product for sale, may have a display spot for that
product, but they haven't bothered to re-stock that product, even though
they've sold out of it...

Hi,

We also need to remember that circuit boards in home appiances are not fixed anymore when they break. Take something in for repair and they replace the whole circuit board. Today electronic components are only needed by Hams, hobbyists and people creating prototype electronics. The biggest profit margin is made on the larger items, not the small components, and store floor space has to pay for itself.

Paul

616. [aprssig] Business 101 [was: About RadioShack -> Silent Key for HAM Radio]

From: "Ev Tupis (W2EV)" <w2ev@arrl.net>
Date: Fri, 29 Nov 2002 09:00:37 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-108945-2002.11.29-08.47.20--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I almost didn't jump in on this thread. :o) There is an APRS 'hook' at the end. Please take the time to read this through as it will offer insights that some may have overlooked along the way.

A quick lesson in Business 101 for those interested in knowing why this is happening. I speak from experience in working for Radio Shack for 10 years (25-years ago) and from being a store manager when being one really meant something.

o The highest profit margins in the store are the component and accessory sales.
o RS will run sales on items with "break even" profit margins, just to get you in the store to buy higher profit margin items (where they would make their money).
o A while ago, RS installed computer-based inventory terminals and corporate now employs data analysis techniques to spot where their best money is being made. Cost of floorspace being what it is, they will tend to fill it with what makes sense (from a business model).
o If it is being discontinued, it is because -- even with the higher overall profit margins -- there is better money to be made in making other types of sales.

As a class of customers, hams have been their own worst enemy, when it comes to Radio Shack. Even today, we (as a class) make disparaging comments about the stores (even in this thread the term Rat Shack has been used) and the salespeople ("you got questions? we've got dumb looks!). We even make fun of others that shop there saying things like: "Jeez, go to ABCElectronics and get it mail order for 1/2 price."

Now, there is a lament that the era of Radio Shack providing the components that we can use, and providing them conveniently is over? Well, from the steady droning I hear from the anti-RS crowd, I'm suprised I'm not hearing cheering....ah, but human nature as it is, I suppose it's more fun to complain about how things are, then complain about it when it changes, too.

Embedded above is a good lesson to apply to ourselves, in APRSdom. Complain enough and innovation evaporates. By the way...has anyone heard from Gwynn at Paccom in the past few years? "Gwynn who?", says those who have joined APRS in the past two or three years. There's a reason that Kantronics is the only commercially produced TNC "game in town" when it comes to establishing stand-alone digi's, you know.

As for RShack... why will they discontinue product? Because it makes good business sense to do so. The demand is no longer there for it, while it *is* there for other items. Sad? Maybe. Healthy for Ham Radio? Ahhh, that will be the topic for a followup email message, unless Stan puts an end to this thread sometime soon (hint: I think it *is* a healthy sign, but it's not saying what you think it is).

Ev Tupis, W2EV

Rendered body type: text/plain

In reading the manual for an MFJ-1270c, it says that it is open-squelch DCD optimized for HF packet operation. It really doesn't say what that means. My interest is in using it for VHF FM open-squelch operation in KISS mode.

Is there anyone on this list using it this way that can offer insights as to how good it is at this?

Ev, W2EV

Let's shorten this lesson in one word that encapsulates it all: profit.
I think pretty much everyone on here already knew that.

> Embedded above is a good lesson to apply to ourselves, in APRSdom.
> Complain enough and innovation evaporates.

I'm not sure how you drew that parallel. Actually, I don't see why innovation couldn't be born out of complaints.

> There's a reason that Kantronics is the only
> commercially produced TNC "game in town" when it comes to establishing
> stand-alone digi's, you know.

Yep, same word: profit. Has nothing to do with innovation. Even Kantronics stopped "innovating" quite a while ago (in APRS that is). For others there's no dry piece of bread (Dutch expression) to be earned by starting to develop a stand-alone digi now. Business 102.

In KISS mode, the TNC parms are in the computer
and only the modem part of the TNC is used.

Subject: [aprssig] MFJ-1270c, open squelch & HF Optimized?

In reading the manual for an MFJ-1270c, it says that it is open-squelch DCD
optimized for HF packet operation. It really doesn't say what that means.
My
interest is in using it for VHF FM open-squelch operation in KISS mode.

Is there anyone on this list using it this way that can offer insights as to
how
good it is at this?

Ev, W2EV

It can be...but the point was missed: as a class, Amateurs made fun of Radio
Shack (even using terms like "Rat Shack", "Robbery Shack", etc.) and their
employees (using phrases like "You got questions, we've got dumb looks").
Within that context, I used the term "complaints" interchangably with the phrase
"personal attack against which defense is difficult at best, but most likely
impossible".

In the context that you use "complaints" (as an analogy to "positive feedback
against which progress can be made"), the outcome can be quite different.

That, however, is not the context within which complaints about RS have been
made in the past. They were intended to be derrogatory and were made to
audiences that were not in a position to affect positive outcome.

Others may have the last word on this. I'm QRX on this topic.

Actually there is a lot more than the modem being used.  The DCD
operation in this TNC is part of the modem circuit and is controlled by
hardware, not firmware (some Kantronics TNCs, which have completely
different modem circuitry, do employ "software DCD", however).

I don't know what changes MFJ made in going from the 1270B to 1270C,
but the original TNC-2 DCD circuitry, which was used in the 1270B
"worked" with open squelch on most FM/AFSK radios (unlike those TNCs
which used TCM3105 or AM7910 chips), but could have been better.  N7CL
wrote some articles which appeared in PSR several years ago which
described the DCD issues and circuitry which would improve it. TAPR
still offers this as the "2211 DCD mod kit".  This mod also was
suitable for HF but that required a pot adjustment.  The pictures I
have seen of the 1270 front panel don't show any pot, so I don't know
whether MFJ used Eric's circuit with a fixed resistor or made some
other modification.  Since FM is less critical in this regard than HF,
I suspect the 1270C works just fine with the squelch open.

The open-squelch DCD behavior of the MFJ 1270B and others with the
original TNC2 circuit can also be improved by a simple mod (also by N7CL)
involving two resistors and one capacitor.  Eric described this to me
during a packet QSO several years ago, but the only place I have seen
it documented is in the Thenet+ manual.

For TNCs using modems other than the XR2211, TAPR has a "state machine
DCD kit" which provides proper DCD operation for use with open squelch.

Forgot say, that you set all the parms in the BPQCFG.TXT
and TNC to XKISS (or KISS), do a RESET and to the best of my
knowledge everything is done by the 'puter, except
for them modem functions.

Subject: [aprssig] Business 101 [was: About RadioShack -> Silent Key for HAM
Radio]

I almost didn't jump in on this thread. :o)  There is an APRS 'hook' at the
end.  Please take the time to read this through as it will offer insights
that
some may have overlooked along the way.

A quick lesson in Business 101 for those interested in knowing why this is
happening.  I speak from experience in working for Radio Shack for 10 years
(25-years ago) and from being a store manager when being one really meant
something.

o The highest profit margins in the store are the component and
  accessory sales.
o RS will run sales on items with "break even" profit margins, just
  to get you in the store to buy higher profit margin items (where
  they would make their money).
o A while ago, RS installed computer-based inventory terminals and
  corporate now employs data analysis techniques to spot where their
  best money is being made.  Cost of floorspace being what it is, they
  will tend to fill it with what makes sense (from a business model).
o If it is being discontinued, it is because -- even with the higher
  overall profit margins -- there is better money to be made in making
  other types of sales.

As a class of customers, hams have been their own worst enemy, when it comes
to
Radio Shack.  Even today, we (as a class) make disparaging comments about
the
stores (even in this thread the term Rat Shack has been used) and the
salespeople ("you got questions? we've got dumb looks!).  We even make fun
of
others that shop there saying things like: "Jeez, go to ABCElectronics and
get
it mail order for 1/2 price."
```

Now, there is a lament that the era of Radio Shack providing the components
that
we can use, and providing them conveniently is over? Well, from the steady
droning I hear from the anti-RS crowd, I'm suprised I'm not hearing
cheering....ah, but human nature as it is, I suppose it's more fun to
complain
about how things are, then complain about it when it changes, too.

Embedded above is a good lesson to apply to ourselves, in APRSdom. Complain
enough and innovation evaporates. By the way...has anyone heard from Gwynn
at
Paccom in the past few years? "Gwynn who?", says those who have joined APRS
in
the past two or three years. There's a reason that Kantronics is the only
commercially produced TNC "game in town" when it comes to establishing
stand-alone digi's, you know.

As for RShack... why will they discontinue product? Because it makes good
business sense to do so. The demand is no longer there for it, while it
is
there for other items. Sad? Maybe. Healthy for Ham Radio? Ahhh, that
will be
the topic for a followup email message, unless Stan puts an end to this
thread
sometime soon (hint: I think it *is* a healthy sign, but it's not saying
what
you think it is).

Ev Tupis, W2EV

>
Complaints do stifle innovation. More than once I've been ready to throw in the
towel on APRS because of the attitudes and opinions of a small number of hams.

Only the knowledge that behind these few there are vastly greater numbers who
are appreciative kept me going.

For example, when I began building the APRS IS, I got a surprisingly large
amount of hate mail, mostly in the vein of "The internet has no place in the
hobby, you will kill ham radio". These would peak when I would get publicity
outside the APRS community, like a mention in QST or the RAIN report.
Fortunately I am too pig-headed, self-centered, and insensitive to care much
about these people's opinions! ;-) Anyone planning to try to innovate in ham
radio better have a thick skin...

If your intent was that complaints about something will inspire others to solve
a problem, it just ain't so. Innovators solve problems that interest
them...there is no joy in pleasing a complainer.

If you complain about something in findU, I'll listen, and if it is something
that I don't disagree with, I'll put it on the list. The bottom half of my do
list is full of complaints, things that would be improvements but don't inspire
me to spend my precious time on. When I work on something, I look through the
list to see if there is something else I can fix/improve at the same time. But
if you really want something done, don't complain, inspire me instead. An
example is the radar150 cgi I mentioned earlier in the week. A ham wrote me a
nice letter, explaining what he wanted and convincing me it was cool. He had it
30 minutes later. Had he complained that the radar page didn't work on his
sprint phone, it would still be on the list...

Considering Dell has not released the Axiom to the general public, in a
word, NO.   In fact, they keep pushing back the release date.   Last I
checked it was December 19.

I do know somebody who has a pre-production unit and is quite impressed
with it.   Since the hardware is pretty much standard in the PPC lineup, I

see know reason why it should run any differently than on any other PPC.

I will say that pre-production units have shown a problem with screen flicker while scrolling, but I think I could put up with a little screen flicker for a PPC that's 200 bucks less than comparable PPC's.

Not sure what "CYGWIN" is but on Unix/Linux machines, Cron is run at startup and is owned by root (superuser) so you won't be able do do anything with it (for good reason).

You can submit jobs for Cron to run with the command "crontab -e". This allows one to edit the "cron table", i.e. add, change, delete cron jobs. Read the man page on Cron for the layout of the "cron table".

This aplys to Unix based Cron. No telling what has been done on other platforms.

73,
Doug

cygwin is a "*nix" emulator that runs on Windows - from their web site:

"Cygwin is a UNIX environment, developed by Red Hat, for Windows. It consists of two parts:
A DLL (cygwin1.dll) which acts as a UNIX emulation layer providing substantial UNIX API functionality.
A collection of tools, ported from UNIX, which provide UNIX/Linux look and feel."

Rest of the info Doug offers is right on.

Bet you logged in as a user that didn't have privileges to do what you wanted. Try using SUDO or SU

I would like to point out that this discussion was started because the CEO of RS said the company was sticking to their "core values" of being a store where one can buy small electronic bits and components. And I added that they also announced that they intend on dropping the asking of your name and address when you make low dollar cash purchases, something people have been complaining about for over 30 years. Will Radio Shack stick to those promises? I think that's the question.

People say that complainers drive businesses down. Yup. Have any of you gone into a restaurant and gotten bad service or seen the kitchen staff use the restroom facilities and return to work after not washing their hands? What do you do? My first response is to complain to management in person. My second response is to reduce or not tip restaurant staff. My third response is to let people I know who might go to that restaurant what happened to me. A manager's reaction to my complaint goes a long way to restoring my confidence in that establishment. I have found that complaining to regional managers from Radio Shack generally falls on deaf ears.

By the same token, I've worked for companies that subjected me to peer review, "secret shoppers," and CSAT's (Customer Satisfaction Polls) and other methods to gauge how I'm treating the public at large and how good my performance is. And you can bet when someone finds fault they jump on it.

How is a company going to know when it's doing something wrong or offending customers, if it doesn't get negative feedback?

As I've said many times before. I've had some very bad experiences with Radio Shack employees and I've seen many other customers given bad service or bad advice.

Here are some memorable ones:

I saw an RS regional manager try to sell a 10 foot spring loaded whip to a guy who came in to buy a mag-mount CB antenna. She told him he should center mount the whip antenna to the roof of his car! I think some hams here know just how flimsy roof metal is... She actually told the guy that a mag-mount CB antenna (even an RS one) wouldn't give him the performance he needed. The guy inquiring about the antenna left in disgust after about 10 minutes of her techno-babble about radio waves.

I went into an Ann Arbor RS store with a friend to buy a mast-mount FM antenna. The store was out of stock of the antenna we wanted, so we inquired about ordering one. The clerk refused to order one, so we found the store manager who also stated she owned the store. We offered to pre-pay for the antenna. She refused, and when we politely questioned why they wouldn't order an antenna she broke forth with a stream of profanity that would make a sailor blush, and ordered us to leave her store.
I called RS Corporate and related this incident. They told me because it was a privately held franchise, that there was NOTHING they could do about her behavior. BTW, I have worked in the complaint department for TWO major companies. If something like this happened, I would send that person to another store, after making sure that next store would treat the customer properly. I did stuff like that hundreds of times. And then I would give the customer a follow up call to make sure everything went OK. In some instances I would also have a "chat" with the offending employee and his supervisor.

On several occasions when purchasing components or inquiring about products, I've been accused by RS employees of doing something unsavory or illegal. I recently went into RS to look at a deeply discount basic radio scanner. When the salesclerk tried to steer me into buying a more expensive model, I remarked that I was going to just use it for listening to and decoding WX satellites, but that it would require a modification to broaden the receiver's bandwidth. The clerk literally screamed at me... "You can't do that - That's UHH-Legal!" I asked him to tell me what law specifically I was breaking, and he instead went and hid in the stockroom. Rule number one in sales - don't insult your customers or call them criminals.

My Boss (at the time) and I stopped into the Radio Shack in Christown Mall (Phoenix) to buy some components for a project he was having me build. We were in a hurry and manager of the store was ringing up customers. When my boss gave this guy his 3 dollars for the purchase, they got into a protracted "discussion" over the name and address thing. My boss held his ground and pointed out that he wasn't going to give his name and address for a 3 dollar cash sale. The manager responded in a very snotty tone, "Oh you're one of THOSE people..." Yeah, like my boss is some 7th Day Adventist hiding out in a bunker in Texas...

Radio Shack gets derided because they do things that invite derision. They hold no corner on that market. I've worked for companies where marketing doesn't meet reality. And I've taken heat for it, trust me... But you try to do your best with what you've got.

I haven't stopped shopping at Radio Shack. Going there and asking a
technical question of the employees is always good for some comic relief.

Mark

Bruce,

These are Citizen Weather Stations. They only feed into the APRS-IS, and
will not be transmitted to RF. Have a look at: http://wxqa.com/ That should
explain it all to you.

Jeff said a long time ago on here that this is a hobby that you have to
do for yourself. I can only concur with that when it comes to
development in a hobby atmosphere. If one gets discouraged easily by
what other people say about your work, then indeed you need to think
twice before starting a project that may be attractive to the public.

> If your intent was that complaints about something will inspire others
> to solve a problem, it just ain't so. Innovators solve problems that
> interest them...

Who invented the washing machine? :)

I tend to think that products in general will be improved when enough people complain, in the professional world that is. The problem with a lot of folks in the hobby atmosphere is that often they take complaints too personal or as criticism on their work and rather drop the ball than fix a problem or implement a good idea. Or they discuss it endlessly why a problem is not a problem or why a proposed change is bad. Especially the latter can result in stagnation. So I guess I'm arguing that it is the attitude of the recipient of a complaint that may very well get in the way of innovation.

> there is no joy in pleasing a complainer.

Well, if that's the goal, then there's a problem, unless one works in the customer service department. One fixes a problem to fix the problem, not to please the complainer. If in the process the complaient gets pleased, then I do not see anything wrong with that either.

> But if you really want something done, don't complain, inspire me
> instead.

If someone complains, then I try to separate the emotional aspect from the technical one. Not the easiest thing to do at times of course. Even if the complainer has a bad attitude, the complaint may still be valid and may affect others who don't speak up. The bad attitude can be dealt with separately with the person in question. Indeed you catch a whole lot more flies with honey than with vinegar.

....off to digest some more turkey.

Ladies and Gents!

Bill, KC9XG, has written a nice utility program for aiding the in the installation of the States files for Pmaps.

If you are or are going to run Pmaps, it would be a good program to have.
And
it's FREE!

You can go to www.aprsfire.net and down at the bottom of the page, there is a link to the file.

I always did the "cash" thing too. I've never understood why people were so willing to give all their info. It's not Radioshack's fault that they ask, it's the fool who answers with their life story who has a problem. Same as with paying for catalogs, or buying a shirt with "Old Navy" in huge letters on the front and not getting paid for it. Most people are simply sheep who do what they are told or asked for without questioning anything. Affluenza is the name of the dissease I think...

Ok, I'll drop it.

Great thread on Rat Shack, however it needs to come to an end.
Group,

I was under the impression that they (Radio Shack) stopped selling 'real' experimenter and or ham parts in the late '70's. Maybe I should have visited their store more often for parts, however since my above reference, most of what I have needed has been out of stock or on order, so I have ordered most of what I needed via mail order. I guess I should have used their RSU (pay more for it) parts ordering it system.

Mike - kd5dhu

P.S. don't let anyone know that you can purchase parts from reputable companies on the internet cheaper.

Pmap is Precision Mapping V5 that is now fully supported in UI-VIEW.   No more making static maps.   Move and zoom to anyplace in the US down to the street level. I'm 5 miles out in the country in KY and even my DRIVEWAY is on the map.

Best thing that has happened for APRS.
Excellent support from the author.   Quite a few add-ons for UI-VIEW as well.

Subject: [aprssig] Re: Pmaps Utility

> Jim what is A Pmap and where can I download it from--tnx Lloyd w4uzj

Pmaps is short for Precision Mapping. You can download at
http://www.undertowsoftware.com/?AID=9
Although it's name is Precision Mapping Traveler v5.0 and Precision Mapping
Streets v5.0, it has become known and accepted as Pmaps v5.0.
When you buy it, Pmaps v5.0 is sold as a bundle...both Traveler and Streets
for somewhere near $49.00.
Pmaps Traveler or Streets can be used as individual stand-alone mapping
programs. Or...
UI-View32 takes advantage of Pmaps and allows a user to zoom around, pan,
etc all the way down to street
level with ease. My personal opinion is that it is an Excellent combo/APRS
device and the ONLY one I would recommend
for APRS users in the USA that use Windows (see Curt, I was nice! <g>).
(note: Xastir is the one to use if you are a Linux type, without Pmaps).
UI-View32 www.ui-view.com (also make SURE you look at
http://www.ui-view.com/uiview32/uivpmap.shtml) is VERY well supported and I
can not think how on earth it could be supported any better...by the author,
Roger, and by some of it's users. UI-View has a great email support server
and there are a few
of us that do online help with Ui-View and Pmaps on Achat.

There is my sales pitch....it's good stuff, Lloyd!

To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-109035-2002.11.29-22.53.50--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

> Anyone know the source of the weather stations on the APRS IS labelled
> CW0xxx. CW0782 is near me but appears in a residential area of an nearby
> town. Very odd.

Not odd at all. Hundreds of ham/non-ham weather stations around the world
have been sending WX data reports to the APRS IS, at the rate of over
40,000+ reports a day. This has been going on for a couple of years.

APRSWest.net is the primary wx server and APRSCA.net is the backup server.
Most users that access these servers, simply check-in, send data at regular
intervals (10-20 mins.). The data is process and used by many weather
related resources around the world, including findu.com.

I have a real-time display of all active wx stations around the world at
http://wx.kb7zva.com

Please give the page a chance to load. Click on any wx station and the
details will appear on your status bar. Also, more information is available
at http://kb7zva.com

APRSWest.net and other Tier 2 servers offer some very nice features via
many different specialized port configurations.

Dick, KB7ZVA
APRSWest.net

Actually, it's been my experience that many Radio Shacks take a more "pro-active" stance than politely asking for your name and address once and let it go when you say "cash." As was my boss' experience at the Christown store. There was an MSNBC piece about this on their web site not too long ago, but I can't seem to find it. They still have the video interview with Leonard Roberts (RS CEO) online.

Leonard Roberts said the process of asking for all that information was "annoying and actually time consuming..." Why would a business engage in a practice that they acknowledge is annoying and a waste of time for over 30 years? Radio Shack's corporate stance on the name and everything was to help honor warranties and refunds. Funny, but I was in Rat Shack and watched them turn away a lady trying to return a recently purchased answering machine because she didn't have a paper receipt - I didn't see anyone at the store offer to look up her information...

I wasn't going to mention this - but it happened to me today 11/29/02 at 5:49 PM central time. RS is closing out their AM/FM Wind-Up Radio #12-801 for $18.00 - They listed for $40.00 in last year's catalog. I figured it would be a good Christmas present for someone, so I snagged the last one they had. As the clerk was ringing it up he said, "You're gonna need batteries for that!" I tried to explain it was a "self-powered" radio, and that yes, you could put batteries in it, but that defeats the purpose of the radio. He then said (and I quote), "No, this radio will not work unless you put double-A's in it." Instead of arguing further I took the path of least resistance and told him I had plenty of batteries at home. Once again an RS employee shows a complete lack of knowledge about the products he sells, which unfortunately is not just a problem at Radio Shack, but they are a company with the corporate slogan of... Ahh, we all know it and parody it. :)

BTW, the radio has a small easily-replaceable NiCad pack and 90 seconds of crank time gives many minutes of listening time. The radio appears to be a quality product and has pretty good sound from the speaker (for a small portable radio). For under $20 it might be a good purchase for the emergency kit.

I think the difference is in the type of complaints received, which Steve addressed indirectly. He mentioned the phone thing, where the guy showed him how the change would benefit the users. That is a complaint/feedback that's actually positive. Too many people who complain are of the "Your (program, radio, idea, etc.) sucks and I'm going to tell everybody so!" variety. Even if they might have a valid problem, it's so wrapped up in negatives that who's going to listen to them. As you say, you catch more flies with honey than vinegar. If it were to be presented as "I've experienced the following with your program. I don't know if you intended it this way or if it's something you overlooked, but have you considered doing xxxxxxxx instead. Personally, I feel it would work better that way." Maybe the guy has always done it that way, maybe he didn't consider another way, but if you call him an ass for doing it that way, he's sure not likely to change.

We've strayed off from APRS on this, but it's been an interesting exchange, and I've enjoyed it. Thanks, Stan, for indulging us in this.

I would have to agree With the list after catching up on my mail. The best
way to solve a problem is to offer help rather than criticisms. To many of
the people that have helped us have not been thanked for the hard work and
effort that has brought us to this point already. I for one would like to
thank each and everyone that has worked on bringing the ham programming to
light and help work out all the bugs.

Rendered body type: text/plain

Hi APRSers,

Does anyone have experience with installing radios (eg TM-D700A + GPS)
into hatchbacks or station wagons? (Hope you know what type of car I'm
talking about, as I'm not sure what terminology is used outside of
Australia.)

I'm looking for ideas on where to locate the body of the radio itself,
and how to actually secure it there. My best thought so far is under the
passenger seat, but I'm not sure how I can actually secure it there.

What about mounting the antenna? A trunk lid mount won't work since
there's no flat trunk to use.

thanks,
Hamish

And to that I'd add that you have to have a vision, and the strength to say no,
otherwise things run around in circles. Perfect example is Linus and Linux...I
read an article yesterday where he said his most important job now was saying no
to people.

If there is a story behind this, I'm not aware of it, so please enlighten me. If
the intent is to imply it was invented by a henpecked husband who was responding
to the claims of the wife, I'd bet that if it did involve a husband and wife, it
was something the husband did because his wife silently silently did her chores,
and out of love he worked to make her life better ;-)

If enough people complain about something, a company certainly will respond
(unless they are a monopoly). Most times they will fix the problem, but other
times they will decide the time and expense of dealing with complaints for a
product or service may be too great, and drop it entirely.

Even in dealing with a business, though, I maintain that a nicely worded letter
with suggestions rather than complaints, explanation rather than exclamation, is
more likely to get noticed, passed along, and acted upon.

The hobby situation is quite different...there is no complaint department, no
customer service representatives who get paid to take the abuse. If findU
generated a hundred complaints a day, I most certainly would fold the whole
thing up, that would be much more trouble than it was worth (even after
considering it gets 100,000 hits a day, and only 0.1% generated a complaint).
>> there is no joy in pleasing a complainer.

>
The majority of complaints I see are not problems, as in bugs, but rather
differences in opinion. I am most definitely not in this to please others, I do
it for myself, because _I_ think it is cool. I enjoy creating the concept,
forging the software, seeing it work, thinking up new pages and new uses for the
system. If it is useful to others, that is simply a byproduct. I do not feel
I've failed if it doesn't meet everyone's needs. I probably couldn't even if I
tried, but if I tried, I certainly would have less to to spend on those things I
find enjoyable and rewarding.

I listen to them all, and I have done some things that came to me in complaint form, because they needed to be done. Doing them didn't bring me any pleasure though, it was a chore that needed to be done, like taking out the trash...the house smells better, but I don't feel any accomplishment. If someone uses findU more than once, they must have gotten something of value. Given that they paid nothing for using findU, I really don't think they are in a position to complain. Most people, when they find a bug or have a suggestion, are able to put it into reasonably worded note, rather than filing a complaint. Those that can't will just have to live with the fact that their opinions matter less to me.

>that's actually positive.

The phone thing I mentioned as something that was NOT a complaint. Maybe a definition from dictionary.com helps clarify:

1. An expression of pain, dissatisfaction, or resentment.
2. A cause or reason for complaining; a grievance.

(the other two definitions, medical and legal, don't apply). A bug report or feature request are not automatically a complaint, it is all in the presentation. Most of the email I get are not complaints. Reading them and answering them (as I do for all of them) is not unpleasant experience. Reading a complaint is an unpleasant experience, and answering one is even more unpleasant, as it usually unleases even more of the same, particularly if it is done on the sig. A lot of these go into the trash without getting answered.

The important point here is that what made this get done was NOT that he showed me how it would benefit users, he showed me it would be cool. It may only benefit him, or it may benefit others, but that isn't what made it happen.

In contrast, the most complained about issue on findU is an option to display results in other unit systems. This acutally is high on my do list, and next time I get into a programming mood it will probably get done, but there is nothing cool about it, like I said this is like taking out the trash. It would be useful to a whole lot of people, but it is not something I can get enthusiastic about.

That people complain about this does not make me want to get it done sooner, in fact just the opposite is true. So if you want something done on findU (and I'm sure with most of the other APRS authors here) don't complain, inspire me!

Hamish,

I have a Jeep Cherokee 4 Door. The D-700 body is mounted under the rear seat. The mounting screws only go through the thick insulation between the floor and the seat, but it is not going anywhere due to the size of the space it's in. Has worked well for a year and a half.

The control head is mounted to the headliner above the rear view mirror. Makes it viewable for driver and passenger, out of the way, and not easily seen from outside the vehicle.

For an antenna mount I use the Comet one designed for SUV/Hatchbacks (RS-21). It is adjustable in multiple ways to get your antenna vertical no matter what the angle of your hatch back is, and attaches like a trunk lip mount with 2 screws. MFJ makes a similar one called the "Ruff Rider", but I have no direct experience with it.

I use a Z-750 or SBB-7 antenna depending on the situation. Both are at least 5/8 wave on 2 meter, and do not require a ground plane. Both have worked well for me, the Z-750 for day to day use (it will clear the garage door), and the SBB-7 for Public Service Events and ARES work (when I want some extra gain available).

Hope this helps.

In defense of RS, there are stores with employees that care about their job and actually try to help people. There are several in this area. It is hard to
employ someone in that position for any length of time and it has less to do with the paycheck than it does to do with the way customers tend to treat any service person they see.

We're not here to drop everything in our hands and help you the second you walk
in the door because you can't see that I am on the phone with a customer trying
to explain how to hook up their new DVD player, or the old guy in the back thats
spent the last 45 minutes pawing through the clearance bins complaining about prices and how we don't carry the part he needs anymore. (Don't try to point out
the fact that in the last 4 years, hes the only person you've ever had ask for that
part). The people (They are people too) behind the counter are genuinely trying

their best, sometimes they don't know any better, and the other person that
replied
to you is right, instead of scoffing at someone thats trying to learn and
earn a living
who only knows he was told to add batteries onto every sale, why not just
show him
it really will work without batteries so you can save someone else from
having to
correct him.

Some of you should recall that a lot of amateurs at one time or another have
worked in a RadioShack, and many may still do so, myself included. I may
not be able to tell you the value of the toasted black resistor you carry in
in a plastic back, but I will try my best. I certainly can do my part to
educate
customers on radio services, what they are capable of, and what they need
to do to get a license, amateur or otherwise.

I'll crawl down off my soapbox now, but remember what was pointed out in
the original
part of the thread... We've done it to ourselves, so complaining about
stock is much like the
quote about not saying anything until one finds they've taken away all your
rights.
Bad service prevails everywhere, from retail, to service, to industry, both
internationally
and at home, complaining about it is only academic... Next time try to fix
it, instead of forcing
a salesperson into mirroring your attitude about the store your in.

>> My best thought so far is under the passenger seat, but I'm not sure how
I can actually secure it there. <<

Hamish,

Under the seats in my Chevy tahoe truck is where I have the body of the
D700 and 706MkII. I used a piece of 1/2 inch plywood cut to fit under the
seat and the mounting bracket is screwed into that. If you find it slides
around, simply nail several 3/4 inch nails through the plywood so that they
protrude below and that will stop the sliding.

>> What about mounting the antenna? A trunk lid mount won't work since
there's no flat trunk to use. <<

I use magnetic mount for VHF since its easily removed. The HF mount uses
the trailer hitch.

And some years ago I went into the RS store I preferred to give my
business to because they had such small volume and dreaded going to the
mall to acquire I think it was the 36 foot pushup mast. A clerk that
normally wasnt there proceeded to tell me they didnt sell towers. I ask
for a catalog showed it to him and got a small "oh" out of him. They
didnt stock it, but the mall store did. When he was on the phone with
them he asked them if he could ring it up(for the commission). After he
hung up I told him I preferred to pay for it at the store I got it from.
In actuallity had he been a little more customer friendly I probably
would have paid there and let him have the commission, but having to
convince somebody that they do indeed sell something irks me just a wee
bit. :)
I believe that was my defining moment of going elsewhere whe at all
possible for parts unless it was a just got to have it to fix something
today(usually limited to fuses and coax connectors)

Good afternoon:

I saw this on the ARRL web site the other day, and used it to look up and
print a manual for a radio I got on clearance at Radio Shack. While I was
there, I also found service manuals for a couple of my other rigs and
downloaded them. It doesn't have all the service manuals, but it's certainly
worth a shot for the price. FREE !!!!

```
Hi Hamish,

couple ideas: (installing radios, mostly FD, LEO, other PS and
commercial stuff is what I seem to be doing a lot of these days. Yea,
towers are a lot more fun!)

Put the mounting bracket under either front seat. Use self tapping
screws and just go down through the carpet into the floor pan. Make sure
you don't 'accidentally' go through anything important, like other
wires, brake lines, etc. Be sure you can access all ports, plugs,
switches and whatever else may be on that radio AFTER it's mounted. Good
idea to check for seat travel before hand too. Sucks to rip a rig out
just cuz auntie Elma slid the seat all the way back for ya.

Other good locations for remote mounts:
 Under any seat
 Inside the trim panels in the back, behind the rear seat
 back up behind the glove-box (select few vehicles will allow for this)
 remove glove box and replace with radio - keep the door to hide things
 depending on seat construction, back of a rear seat
```

As to the antenna - use an NMO type mount, a base loaded 5/8's wave and
center roof top mount that sucker. You just pull the head liner down a
bit (yank the door seals off the top off the door frame and you'll see
the handy routing) and run the RG-58 down the B post to that under seat
posistion. What with everyone doing the cell phone thing these days,
having an NMO mount in place sometimes actually helps resale value -
sometimes. Seems very few're worried 'bout drilling holes in new cars
these days.

GPS receiver? Really depends on what kinda receiver - weatherized? - can
it go on the roof too? Dash mount - in the rear cargo area by the back
window - any place where it can get a view of %60 or more of the sky.
(%60 is a subjective value based on my use of the DeLorme Tripmate and a
Magellan 2000XL - hey, they're working for me)

Good luck!

> Good idea to check for seat travel before hand too. Sucks to rip a rig out just cuz auntie Elma slid the seat all the way back for ya.

Cable pathways also, don't be routing that 8Ga power bus through the "electric scissors" of the power seat :)
Run it end to end and up and down if applicable, and make sure you aren't in a danger zone.

My Expedition (and many other cars) has a large channel underneath the door sills. In my case, it's about 2" x 1", which is relatively huge :)

>Other good locations for remote mounts:

Some cars have a tremendous amount of room in their center consoles that is totally wasted. A friend just installed a D700 there, and has room for about two more without crowding.

>As to the antenna - use an NMO type mount, a base loaded 5/8's wave and center roof top mount that sucker.

Beware floopy roof metal!
http://www.inchase.org/outflow/events/installnic2002/f5Mount.html

>GPS receiver?

In my explorer, I had good output from the Lowe's antenna mag-mounted to the car radio, IN the dash. The extra gain made up for the attenuation, and it was totally "stealth" and weather protected. In the Expedition, I've got room under the rear plastic panels over the wheels, and I'm considering a tripmate mounted there. It won't see 60% though. 50% tops.

There are roofmount antennas for GPS that are very small, and that's another option. I dislike messing with the headliner much though.

I put all my radio gear in a pair of consoles from Scientific Dimensions. The one up front carries the TH-D7A, Gall's switching system, strobe pack, and SSTV scan converter and screen. The SSTV camera is dash mounted in a so-so mount, I'm looking for better.

In the rear, I use two vertical brackets from SDI to mount the two FT-1500s, (SSTV and APRS) and the TNC. A USB serial port plugs into a four-way hub, and the cable up to the front has a powered repeater because of the distance.

I keep one of the stock mics back there with the 1500s in case it's ever needed as a backup to the main voice rig. In an emergency, I can convert the SSTV station into an additional operating position at the tailgate.

A 20AH gell cell straps to the side of this rear package, and of course everything's powerpoled. I used the larger size (75A) for the main power feeds. #4 from the battery to under the dash, then split to two #8 feeds, one for the front, one for the rear.

I am currently using glassmounts for SSTV and APRS. It's a bit of a compromise, but I'm reluctant to go with anything higher profile there. A helical filter scrounged from an old motorola radio keeps the APRS out of the SSTV.

KC7ZRU - Tate wrote:

>
> As to the antenna - use an NMO type mount,

Might I respectfully suggest an SO-239/PL-259 mount if you are active in emergency/ARES operations?

I've converted all my mobile antennas to this and it has several advantages:

1. I can easily remote the antenna to a mast or higher location on a mag mount and run standard coax between the antenna and the mount. No need to swap connectors at the radio body (buried under the seat). For Public Service events, I regularly run up a 15 foot mast with my antenna at the top for extended simplex/cross band operations. (As I stated in my original post, both are at least 5/8 wave on 2 meter, and work well enough without a ground plane for my purposes.)

2. I can run up a beam or other antenna (GP-3 is a popular portable antenna locally) and hook to the mobile radio at the antenna mount. Quick to disconnect and swap back to mobile antenna if I need to move.

3. I can use the mobile (or spare) as a separate base station antenna,
again using standard runs of coax.

  The biggest advantage to the NMO mount antennas is that they are
cheap, and easy to find. You have to search for the ones using SO-239,
but they are out there (Comet carries them) and they provide a lot more
flexibility.

My cliche'd $0.02 worth

I find it odd that several people here operate under the assumption that businesses and complete strangers want your "help" or instruction.   I've often found that correcting people you don't deal with on a regular basis makes them mad or at least uncomfortable.

Also consider the fact that it was the day after Thanksgiving and the store was crowded with people trying to make purchases.   I would've had to unbox and unwrap the radio, remove the back cover, install the NiCad pack, crank the radio for several seconds, and then demonstrate.   All that would've delayed someone else from getting out of the store and on to the rest of their life.

Good points there Randy - but, if all your agencies are using NMO as a
standard, then the ham that shows up with PL-259/SO-239 is the 'odd man
out'. It's VERY handy to be able to through a ham's 2m rig into a patrol
car and simply 'plug 'n play' using an existing antenna mount.

Plus - if it's good enough for the commercial, everyday emergency
services world, there's likely a reason - maybe. Though it's likely to
be strongly economically influenced as you referred.

Randy Allen wrote:

Mmm, I think we're on the same idea here - the radio keeps it's SO-239
connector, it's NMO at the other end. There *are* NMO "male" type
connectors. Idea is you unscrew your roof mount antenna, screw on this
NMO 'male' thinger (Maxrad, Antennex and others have 'em), it's got the
length of cable on it you need and you simply mount your screw on
antenna where you want. Mast, Mag, other vehicle, side of building -
whatever. The flexibility is a good idea! It's just been more
'traditionally' done with PL/SO (UHF) type connectors.

>  2.  I can run up a beam or other antenna (GP-3 is a popular portable
> antenna locally) and hook to the mobile radio at the antenna mount.
> Quick to disconnect and swap back to mobile antenna if I need to move.

Same idea - yea, I like. But it also can be done with NMO. And with the
recent news on Radio Shack and their implied 'change of foucus' when it
comes to hams, availability of PL/SO(UHF) connectors isn't likely to
remain the advantage it was.

> 3.  I can use the mobile (or spare) as a separate base station antenna,
> again using standard runs of coax.
>

Yea - same here, just we're using a different 'standard' :)

Oh, it's worth a bit more than that. Good reminder that *any*
installation aughta be flexible. Plan your flexibility!!

Best to ya

That's what they make adaptors for!   I have BNC-SO and SO-BNC in my kit, and an NMO-SO.

A basic adaptor set should be in everyone's go-kit.
I intend to make up some powerpole to clip leads or something similar, for that end of it too.

I always tell the clerk "I just need to pay".

They move on and after a while, these clerks stop asking me...

Boy do I agree with this!! In addition to the examples you mention are
the 'brain proud' idiots (I'd say something else in private) who go into
RS seeminging on an agenda of trying to prove how much more they
know than the employee.

Mike

I prefer the NMO as a more rugged and water tight mount than the SO-239 type.

An acceptable alternative if you are using NMO or want to is to keep some
NMO to SO 239 adapters.

To see one look here:

http://www.pl-259.com/page5.html

I'll give you both your comments and add one:

I purchased the last of stock of capacitors a local store had only to find
out that I purchased the wrong type. Mind you, this was a "cash" purchase
and I refuse to ever give them my address as I am tired of receiving their
flyers. Anyway, when I returned them the manager insisted that I give him my
address because their cpu system doesn't allow cash refunds. After a few
minutes of discussing with him that the sale was a "cash" sale and that I
gave no address to make the purchased that the reciprocal refund also needed
no address. It took a threat to make a phone call to corporate headquarters
that prompted him to make the refund without an address. And I did have the
sales receipt.

All in all, Radio Shack means well, and for small electronics projects (and
emergency parts for certain audio projects) I don't mind spending a few
```

bucks rather than waiting for a mail order.

I tried the best I could to do due diligence and searched the APRSSIG archives for the answer to no avail so I'm asking one and all:

Taking advice(?) on the cheap price of the HTX-252 at Radio Shack (I bought two) for running packet and/or APRS. The pinout diagram on Buck's website (http://www.packetradio.com/!TNCables/a232rs252.gif)shows a resistor and capacitor on the PTT and TX audio leads respectively but gives no values for them. With circuits never my strong suit, could I ask some knowledgeable person's help please in solving this problem of values. I wish to interface the HTX-252 with a PK-900. Any other advice you wish to dispense will be cheerfully accepted.

Thanks in advance.

I've been around just shy of 32 years, but I was never asked for my address until a bomb downed the flight over Lockerby, Scotland. I was told that they needed addresses in case of a similar incident. That was the last time I ever gave it to them because I was always given a different story. Seems they'll do anything to find out where you live to leverage their marketing tool: flyers.

Anyway, as I've mentioned in a similar post, Radio Shack means well. I just dislike their marketing ploy.

Rendered body type: text/plain

Hello to the group.

I am new to aprs and to aprs dos program. I have one question regarding this particular program that I hope someone can help me with.

When I run aprs dos on my compaq 486 laptop, the program only uses the middle 2/3s of the available laptop screen. I does not use the upper or lower parts of the screen.

I have several other dos only programs on my laptop and they all work fine and use the entire screen.

This laptop is a 486 machine with only dos installed as the os. There is no windows on the computer.

Can anyhow help me here? How can I force the program to use all the screen. Are there some setting I need to change?

Thanks,

Dave

If lack of a radio has been keeping you away from exploring and participating in Beaconet on 10 meters (speaking of innovation!), Radioshack has the HTX-10 now on clearance for only 89 dollars. Excellent radio for the money, even if you want to do silly things on it like talking 'n stuff.

```
I'm in the process of building a stand alone beacon (meaning without a
PC) using a PSK31 PIC board ($25) and a timer circuit ($5). A picture of
this lil' project can be found at http://www.kr1st.com/board.jpg.
Nothing earth shattering, just fun! When the project is finished
(waiting on a reprogrammed processor) I'll set up a page  with a
complete project description.

Joel, Thanks for the tip. I tried it. It made the map easier to read,
however, it still only uses the center 2/3's of the available screen. The
top and bottom 1/8 or maybe even closer to a 1/4 is not used by the program.
Once again. All of my other dos programs on this machine use the entire
screen. Any more thoughts on this.

Thanks,

Dave

Your terminology was right on, unless of course you mean a different type
of car than most of us are thinking of... <G>

A couple ideas I haven't seen yet amongst the many ideas.
[Radio Mounting]
Something I'm doing on mine (just got 'em mounted so I have no long term
data) is based on an idea I got from the car stereo guys. If your vehicle

happens to have an automatic transmission but is also available with a manual transmission take a look under the dash. Mine had 4 nice sturdy studs for mounting the clutch pedal assembly that I don't have. Since I don't have it there was a bunch of room there too. I mounted both radios vertically to encourage convective cooling. One has a thermally activated fan anyway, but I have room to add a fan if needed.

I originally looked at under the seats but found there were several large bundles of cables under both front seats and mine has vents for blowing air under the seats to heat/cool the rear seat passengers. (cooling seemed like a good idea, not so sure about heating the radios!) As others have mentioned mounting the radio to a piece of plywood cut to fit under the seats may be just the ticket. I used a variation of this for the temporary installation in the XYL's minivan and in my older car. The plywood is cut wide enough that it won't slide out (has to be tilted for installation) and has both a radio and TNC mounted to it.

Additional tip especially for occasional installations...
Check to see if you have a power seat connection present. Our minivan did not have power seats but sure enough had the wiring for one. Nice 30A fused always on connection... I used insulated spade connectors to add a short extension and my preferred connector on to the existing one because I couldn't find the connector locally. Yeah, running your own wires has advantages but getting anything through the firewall of this particular vehicle is miserable. I also ran a feedline from under the seat to the back of the van and terminated it in a socket.

All I have to do to become radio-equipped is slide the radio board under the front seat, hook up power, hook up antenna and place the face plate in the pocket. At the back of the van I slap the magmount antenna on the roof, drop the feedline through the vent window and connect it to the pre-installed feedline extension. It works well enough that I've used it to contact PCSAT.

Oh - On the "temporary" installation the faceplate is mounted to a square of aluminum that fits into the pocket on the dash. I've got a bunch of weight (steel shot in 2 tubes) on that square to help it stay put. On my rig I've removed that pocket and built a little shelf of aluminum angle that will hold the faceplate and TNC. (The TNC sits completely behind the faceplate.) I got a square of ABS plastic from the car stereo guys that I'll cut to fit around the faceplate and fill the opening. There's just enough room that I should be able to have the mike hanger there too.

Bill

Might look at some of this software:
  http://radio.linux.org.au/?sectpat=All&ordpat=title

Some prebuilt packages for various things; and a little ham radio stuff:
  http://freeware.sgi.com/

Sound related stuff (FFT, etc) may not work without some code changes.
I'm not familiar enough with Irix to know. Seems like everyone has
their own slightly different ways of doing audio on Unix.

If nothing else a neat OpenGL greyline callsign map for your X root! ;-)

683. [aprssig] Saving PalmAPRS logs

From: wa4ikq@nevets.oau.org (Geoffrey Dick)
Date: Sat, 30 Nov 2002 23:36:52 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-109171-2002.11.30-23.25.01--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Has anyone found a way to save a PalmAPRS log file?

My Palm IIIxe has 625 stations stored in it from a round
trip to Cleveland, Ohio, Beaver Falls, Pa. and Orlando,
FL. in this last week of November.   Before clearing the
Palm for another trip, I would like to save the record somehow.

Any ideas?

Geoffrey Dick, wa4ikq

Rendered body type: text/plain

```
I need to make my Christmas wish list and was wondering which of the
Palm Pilots will support APRS.  I seem to recall there was some issues
about memory and needing to upgrade before APRS would work some time
ago.

Also could some one tell me if the RDF capabilities of APRS are
supported in the Palm Pilots.

Thanks,

Is that space visible, or behind the panels? My new car doesn't have any
spare panel space; I'm still trying to work out where to put the remote
head for the D700A.

Depends greatly on the car.  He put the head in an overhead console (factory) thingy for a garage door
opener.

I guess cars differ quite a bit from country to country.. I haven't seen
too many with overhead consoles (maybe in 4-wheel drives, which is what
we call your "SUVs"). For that matter I've never heard of a car with
powered seats!

Thanks everyone for your help.

Cheers

Cars with power seats are relatively common here, but both his and mine are SUV's. He has an F-150 truck, and I have the passenger version of same, the expedition.

Hello, Hamish

Mostly, I lurk on the APRS reflector; occasionally, I find something to which I can contribute. Your comment about powered seats aroused my professional interest!

I'm engineering manager for an automotive electronics company. Happens we manufacture
about 70% of the sensors used in "memory seats." Memory seats are a special subset of "powered seats." Memory seats not only have three (or, four) dc motors to move each seat around, they also have position sensors on each motion so that the intelligent, microprocessor-based controller can move the seat to position combinations unique to three or four different drivers.

True, these are found mostly on higher-priced cars. However, we ship millions of these sensors per year in many different versions. Each design is unique to a particular seat track (the mechanism that moves the seat) and sometimes to a car model. Hence, we have many automated production lines building many different sensors!

Think that decadent? We also build pedal position sensors for motor-positioned brake and accelerator pedals. Why move the pedals? Well, those short ladies who move their front seats forward so that their short legs can reach the pedals greatly endanger themselves by positioning their torsos against the steering wheel. Bang! goes the airbag; not a good thing. So, some cars now have memory-positioned pedals as well as seats. And, of course, also the outside rear view mirrors. I'm not kidding you!

We also built higher-technology sensors, especially electronic steering sensors. Cars are headed to drive-by-wire technology. Already a new GM truck/SUV steers the rear wheels (yes, the rear wheels!) electrically using a multi-turn rotary position sensor on the steering column. And, many (large) farm tractors are already steered only electrically using our steering sensors; gone is the mechanical or hydraulic connection to the steering wheel.

We even make quartz solid state gyroscopes used to determine where the vehicle is actually headed so that this direction can be compared to where the driver is telling the car to go; if different, electronics take over the anti-lock brakes to stop a presumed skid.

Used to be cars were mechanical. Today, cars have lots of electronics aboard!

Me? I drive a safe Volvo with manually-positioned seats. And, I don't move the seats around much, either! My ham equipment is mounted in the under-floor storage compartment in the rear of this station wagon, suspended from the underside of the access door.

Well, your comment about car seats just got my attention. I hope you don't mind the response!

Anaslime! I used to live on Orangeood, near Harbour :)

As long as this is all done very carefully, I have no problem with it. Silicon and software is a lot less expensive than machined iron. Debacles like the 8-6-4 caddilac make me very nervous though.

IF, and thats of course an "IF", then this radio will be a good uplink for
the PSK-31 Transpnder we plan on putting up next year.  Uplink SSB PSK-31
on 10 m and donwnlink on 70cm FM...

Hi,
I have to wonder what patrol car leaves an antenna unused to allow a mount
for your ham rig?  None of our locals have an unused antenna on their cars.
Budget 50 bucks for the mount and labor to mount it and multiply that by 40
cars?  $2000 bucks for unused equipment?  I have to beg your pardon on this
one.

A Motorola tech told me that the NMO mounts with 1/4 wave whips are for easy
replacement if they break.  Twist off the old base and put a new one on in
less than a minute.  Carwashes, tree branches, hoodlums, etc., that break
them make the NMO type a cheap alternative to other more costly systems for
an antenna.  Having the antenna break away saves the roof or trunk that they
are mounted in.

73,
Chris

Thanks! I just went out and got the last one at my local store. (Will come
in handy if we get to put our PSK-31 10m uplink trasnponder in orbit next
year.)
Also they have the MURS Business band mobiles on sale for $49
and FRS Basestations for $39
and FRS Mobiles with external roof-mount antennas for $29.

Chris,

Many different jurisdictions do things very differently than other
jurisdictions. Out here in Wyoming, our biggest city's PD - Casper -
would LOVE to have 40 vehicles. It ain't gonna happen until the rest of
Southern Cali moves out here and does more than just increase the tax
base.

Casper just converted from their existing VHF radio system to a brand
spanking new 800Mhz trunked (and encrypted) system ($3.5M). Boy, ya
should hear the scannist whine! All vehicles (PD and FD) required new
antennas and feed - least that's what the contract said. Contract also
stipulated new everything installed and several vehicles wanted to
retain their VHF capability - voila - 'surplus' mounts. It ain't a case
of the agencies installing standby mounts for us! (I wish!) It's a case
of using what's there - knowing your resources and adjusting your
go-kits to fit.
```

Another option:
Since *many* agencies install multiple radios with their own antennas, the chances of a ham finding an unused feedline and mount during an 'event' are not at all extreme. These same agencies very rarely use all their radios at any one event. Again - it's a 'get involved' with your local agencies, learn their procedures and see what's there for resources - plan ahead kind of deal. If you can reasonably anticipate you *may* have access to an existing mounting system - be ready for it. Why jury-rig up a 'make-do' that could be prone to 'mis-behavior' when a perfectly good option exists? Of course, that also means you have to be ready for there *NOT* being an existing system. It's called common sense.

1/4w whips on an NMO mount are often a technicians 'easy out'. If you're setting up a vehicle with the usual coil and whip and keep on getting a 'poor' match, guidance is to slap on a 1/4 wave. That'll help isolate as to whether or not you've screwed up the feedline someplace (common), have a FUBARd coil (rare) or are simply being an idiot about the whip length (it does happen). Also, for those officers that complain about the sound of dragging their longer whips on garage roofs, a 1/4w quiets their noise very nicely - on several levels. <g>

NMO mounts are commonly used due to a balance (read: compromise) of many factors: cost, effectiveness, ruggedness, availability, weatherization, cosmetics, ease of repair, manufacture's provision, conveyance, etc, etc.... As such, NMO's gained a 'perception' in the public service community as being a 'professional' system. Whereas PL-259/SO-239 is often un-justly seen as an amateurish 'make-do'. Something 'those CB types use'. Just ask your local APCO certified tech what a 'good mount' is.

Chris Rose wrote:
>
> Hi,
> I have to wonder what patrol car leaves an antenna unused to allow a mount for your ham rig? None of our locals have an unused antenna on their cars. Budget 50 bucks for the mount and labor to mount it and multiply that by 40 cars? $2000 bucks for unused equipment? I have to beg your pardon on this one.
>
> A Motorola tech told me that the NMO mounts with 1/4 wave whips are for easy replacement if they break. Twist off the old base and put a new one on in less than a minute. Carwashes, tree branches, hoodlums, etc., that break them make the NMO type a cheap alternative to other more costly systems for an antenna. Having the antenna break away saves the roof or trunk that they are mounted in.

Does this radio support cw or just phone and packet? And has anyone used the Vectronics VEC-214 Iambic keyer paddle that RS has for $50? I would consider a package deal so I can get some cw experience...

Xastir may work on it. Don't know of anyone who's tried it on IRIX,
but if you have GNU development tools on there it might work without
changes.

If you _do_ get it running on there and have changes, feed them to me
and we'll make it another supported platform.

It's too bad that only scanner enthusiasts find this trend
disturbing.   I'm very uncomfortable when I hear that US law enforcement
wants to operate in an environment that doesn't allow for public
scrutiny.   It seems to me that this presses a posse comitatus issue, but I
would be in the minority on that one.   I was living in Chicago when the PD
bought a tank and started using it against civilians - that disturbed
enough people that the courts stepped in.

I seem to recall that police officers involved in the Rodney King incident
incriminated themselves over their MDT system, becuase they thought it was
secure. Fortunately a few of those whiny scanner enthusiasts turned over
transcripts to the local press.

  What's next? Police officers with no name tags and wearing face masks
all the time?   I bet ya the Ashcroft crowd would love that, so I better
not give him any ideas...

>>> cw or just phone and packet?

No CW out of the box, but there are a few mods I have seen on the web to
make the radio full break-in capable. I was kinda hoping to try it out and
do some mobile CW on 10 M from my truck. I typically work 10M phone, but I
would like to try my hand at some CW and maybe learn it all over again.
(I'm just glad I passed my code way back when and got it over with!)

You must've missed the Pinto airplane, then. Used in a few movies, one of them a James Bond flick
(don't remember the title). Very neat little beastie. Highly impractical, but very elegant.
Good thing there aren't many rear-end collisions in the air! 8-}

That was the joke, a Pinto was never a very good car and a worse airplane. I seem to recall that the actual marriage of the Pinto and a Cessna Skymaster crashed after just a few short flights.   The Pinto separated from the wing package in the air, killing both guys who started the company.   The concept was called the Mizar or Mitzar depending on who you talk to.

The company that did this was called Advanced Vehicle Engineers out of Van Nuys, CA.

http://www.fordpinto.com/mitzar3.htm

```
The car/plane used in the Bond movie - "Man with the Golden Gun," was an
AMC Matador.  It was jet powered and it never really flew - all flying
shots were miniature models.   The other car that did the spectacular 360
rolling jump in that movie was an AMC Hornet.    Pretty blue collar for
international "spies"...    I just can't see James Bond driving a Gremlin
or a Pacer.  ;)   Well maybe Roger Moore.

My other question about Bond movies is why do they always need super
computer and an antenna the size of Aricebo to program the city destroying
satellite?   Couldn't they just use an Arrow II antenna, an HT, and a Palm
Pilot?

Silicon and software is a lot less expensive than machined iron. Debacles
like the 8-6-4 caddilac make me very nervous though.

I'm no engineer but I'm guessing the machined iron will still be needed and even possibly more of it. Surely some hydraulic or electric motor/servo will be needed to do the actual work even if it's controlled by some sort of electronic sensor on the steering wheel. for some time there have been tractors that have no mechanical control of the steering just relying on hydraulics. Engine dies or the tractor is in a position the pump can't pick up enough fluid= no steering. Been there done that. Only a strange feeling at near 0 speed but a terrifying thought at 80 mph.--73

Seeing all the recurring discussions about path setting, that would be
an excellent idea. You volunteering? There used to be an aprshelp.com
site but it seems to have gone belly up. I think I read once that it was
going to be moved to a different server, but that didn't happen I guess.

Reply-To: N5VHO@AMSAT.Org

I'm looking for any stations in Wyoming and Delaware
to help me finish out my goal of working all of the
lower 48 states via the International Space Station
digipeater.

Please contact me to arrange a sked or let me know of
any stations in those state so I can keep an lookout
for them.

VE4, VE5 and VE6 stations would be an added bonus.

Thank you and 73,
Kenneth - N5VHO

On a similar note, the Ford/Mazda long cab PU's have a nifty mounting space behind the jumpseats for
remote mounted radio gear.

39. [aprssig] FRS & GMRS

From: Joe Mayenschein <mayen1@mwt.net>
Date: Mon, 02 Dec 2002 17:24:22 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-109377-2002.12.02-18.03.51--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Now I'm not trying to open a new can of worms, But remember when I was
asking if it was legal to run APRS on the FRS or GMRS bands?

And I got a resounding No from the group.

So I'm a bit confused right now, especially with the FRS rigs where I
was told that Digital was not allowed in any way.

The reason for bringing this up was yesterday I was watching Tech-TV and
they had their top twenty gifts, and someplace on the list were these
two FRS radios, with built in GPS's! full displays ,, mapping stuff and
you can send your position to other users too,, check out the site
below,
http://www.gps4fun.com/gar_rino.html

It says,,
Introducing
GARMIN INTERNATIONAL
RINO 110/120
GPS-Integrated FRS/GMRS Radios

KEEP IN TOUCH - KNOW WHERE YOUR FAMILY
IS IN THE WOODS OR AT THE PARK

GARMIN International is proud to introduce its
first two
GPS-enabled handheld devices for the Family Radio
Service
(FRS) and high-performance General Mobile Radio

Service
(GMRS) markets the Rino 110 and Rino 120. These
GPS
devices integrate radio functionality to provide
two-way
communications up to two miles using FRS channels
and up to
five miles using GMRS channels.

Inspired by the distinctive offset FRS and GPS
antennas that give
the devices their Rhinoceros-like appearance,
GARMIN designed
the Rino series as powerful, robust Radios
Integrated with
Navigation for the Outdoors. They are also the
only
waterproof two-way GPS radios on the market.

What really separates the Rino from the rest of
the FRS/GMRS herd is the ability to
"beam" your exact location to another Rino user
within a two-mile range. This is called
Peer-to-Peer Positioning (see below for additional
information).

The Rino boasts GARMINs traditional tough,
lightweight, waterproof design to handle the
rigors of any outdoor adventure. And because the
Rino has standard FRS capabilities, you
can talk to friends or family who own conventional
FRS radios.

So what's going on here? is APRS legal now on the FRS bands?

Joe

Yes, this is true. I have been checking these units out for some time now
waiting for them to come out. I would like to get my hands on one just to
see what "data format" is being used and see what is required to decode it.
Potentially some kind of spin off of 1200 baud packet or maybe even
faster!

If you pay attention, several venues including Tech TV mention that the
data positioning is "still pending FCC approval". I can't see how it's
pending yet the units are being sold already.

I mean how many times have you seen a really great new piece of ham gear,
but it's only there in the ad for the pre-interested because the FCC has
yet to approve it for use in the US? But on the same side, you can't buy
it yet for use.

I'm afraid that the FRS/GMRS spectrum is quickly becoming a new citizen's
band. Have you listened to the traffic and activity on them in any heavily
populated areas? But that is a side issue that really has nothing to do
with us hams.

I plan to buy on of these units as soon as the price drops (more than
likely shortly after Xmas). I actually use commercial Motorola SP50's for
FRS, their spectrum falls right in the FRS frequencies :o)

Anyone know of a mfg of a 440 rig capabable of 9600 bd for a backbone
link?
It needs to be QRP on RX especially, since we run a 100% solar powered
voice repeater and APRS WX Digi. Mobile rig's consume too much power in
RX.
Any ideas from those who dabble in 9600 bd packet?

46. [aprssig] Mobile Installation Ideas

From: Lee Besing <leeb@stic.net>
Date: Mon, 02 Dec 2002 23:30:14 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-109417-2002.12.03-00.14.08--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I recently finished (re)installing mobile radios in my van and the wife's car.   In the case of my van, I bought one of those consoles that fit between my bucket seats and hid the radio body inside, with the remote head mounted in the front cup holder area. In fact, the particular model I used (from Steelhead) had a swivel mount for adjustable cup holders. I removed the mount, put a longer bolt up through the hole, and mounted the remote head on that bolt. I can now swivel the head back and forth to allow the driver or the passenger to handle the radio operations while viewing the control head at the proper angle.   I'd attach a photo, but I don't do that with list servers. :)   I drilled holes in the side of the interior compartment to allow wires and hot air to escape.   I used some short coax jumpers to get from the radios to the outside, hooked all the power to a single power block which I plan to connect with Anderson PowerPole connectors within the next couple of weeks. For now, it's hard wired direct to the battery and not easily portable. I added a 12vdc fan and switch (from that store) to allow extra ventilation during warm Texas summers, and mounted a pair of small speakers on the backside of the console to hear the audio better.   (2 radios - 1 ham, 1 CB = 2 speakers needed.)

Resulting installation looks professional and keeps my radios out of sight, out of mind, when someone looks into my vehicle.   Of course I have Ham license plates and a roof mounted (NMO) antenna that has a 12' clearance, so I'm not really in stealth mode. :)

With the wife's Toyota Camry, we put the body of the radio below the driver's seat (non-electric) and she velcroed the control head up on the dash to the right of the mileage reset button, which covers up the 130-140mph area of her speedometer.   She isn't too worried about not being able to see that portion of her speedometer for some reason. The only "problem" she had was the loose dangling cable from the control head, which we fixed by buying some adhesive cable clips from "that store".

Hope this experience helps someone else figure out what to do. Those remote control heads help tremendously when having to work with tight spaces.

That is how the Garmin Rhino works. A friend at work has 2 of them. You have to initiate the posit by transmitting - it does not get sent automatically. Of course, when it comes off of warranty, one could hook something up to automatically do it...(No latrine lawyer responses to that please).

They are really nice radios. I would love to find the protocol to see if I could link those posits up to FindU. That would be cool (as an experiment anyway).

Can you set these for the 2.5 KHz deviation FRS uses?
BTW, the Radio Shack MURS radio is now at $49.95 and can legally run APRS.

I looked all over the Radio Shack web site and could not find this radio!
What is the model number? The 19-1206 does not come up, nor does the
btx-127.

Jim, WA6OFT

```
Is there a map (on the internet) of DGPS coverage THAT INCLUDES THE
FREQUENCIES right on it?  The Coast Guard site has a coverage map, but
frequencies are not posted on it.

        Thanks,
        Earl

Its a 19-1210 and called Business Band Mobile Transceiver.  But it says
on the front of the box that it tunes the nine "dot" frequencies.  5 of
those are MURS I think...

Could I ask those of you who are familiar with APRS+SA to
be on the look-out for a guy named Tom, KC8NJK on a trip to
Florida, from Michigan.  I am not good at APRS yet to be
able to track him, or to even set up the software with much
savy.

I have the unregistered copy of APRS+SA and i own an old
copy of Street Atlas, ver 7.something.  My call on APRS is
W8TCC-12 in Lansing Michigan...  I wished I knew alittle
more about running these two packages together...  But I
don't even know where to start asking questions.

Thanks everyone, and Tom would be thrilled, because he's
new at Ham Radio and he's a retired Emergency Manager from
here in Lansing.  When he asked for ham radio support here
in town, for ARES and RACES, he never thought it was so
exciting being a ham.  He ended up getting a license,
buying a radio and when he retired, jumped over to our side
of the table and began working with the hams in the field.

Thanks everyone and hopefully you all can locate him with
APRS...

73 de W8TCC, Troy

54. [aprssig] GPS for Palm m500

From: BMcLarty@trustmark.com
Date: Tue, 3 Dec 2002 10:31:30 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-109460-2002.12.03-11.15.51--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
The son of a friend (non-ham) is interested in connecting a GPS receiver to
his Palm m500.

Does anyone have an opinion of the Magellan GPS Companion for the Palm
m500?

He has also looked at the Magellan 330X.

Has anyone connected a Garmin GPS III Plus directly to a Palm (without a D7
in the middle)?  As a Garmin fan, I have to ask.

I understand that any combination other than the Magellan GPS Companion for
m500 will bring up cabling issues.

Thanks in advance for recommendations/opinions.

Bill, KM5GE
Jackson, Mississippi

What's the BER rate at 9600?   General consensus here is that
NONE of the name brand rigs supposedly rated for 9600 actually
work well.

I'd suggest the Tekk radios would be the first choice. They work great at 9600
and the 20 ma. receive current will be hard to beat.

   http://www.paccomm.com/tekk.html

Maxon radios, also available from Paccomm, are another option. Price for one modified
for 9600 is a bit higher then the Tekk but they are programmable for multiple frequencies unlike
the Paccomm which is crystal controlled.

Also don't forget that some also have issues with DC coupling on the TX
chain.

Yeap, they where actually designed for 9600bps. Here is a cheaper place to
get them then Paccomm:

http://www.multicom2way.com/tekk-dataradios.htm

-Jeff

Speaking of which...   I dropped a note on the Digi_ned tech forum a couple
days ago and didn't get an answer yet.

http://pub13.bravenet.com/forum/show.asp?usernum=1085172791&cpv=1

Maybe one of the Digi_ned operators
on the list here will have some suggestions. Basically I'm working towards a
Digi_ned configuration where it adds it's own callsign or alias even if the station
originating the packet didn't start it with a generic WIDE or RELAY to allow substition.
This will add a bit more vicinity tracking info to the flow on the network.

Here's the original message:

We're been finding more and more uses for packets where callsign substitution
by the digi's is running. It show's paths and digipeater coverage areas.

This works well is the originating station uses an proper path such as:

wa7nwp>APX,RELAY,WIDE3-3: hello world

or

WA7NWP>APX,REDMND,WIDE3-3: good bye

There's still a significant number of stations not putting in a place for the digipeater
to replace its ID. For example:

WA7NWP>APZ:WIDE7-7:I be a trouble maker

So, the digi_ned question is: Is there a way to catch a packet like the above,
only if it's the "first-digi", and drop in the digi_ned system call.

The packet would be rewritten from:

WA7NWP>APZ,WIDE7-7: stuff

to

WA7NWP>APZ,REDMND,WIDE7-6: stuff

64. [aprssig] WinAPRS question

From: Brad Darnell <darnellb10@comcast.net>
Date: Tue, 03 Dec 2002 17:26:50 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-109488-2002.12.03-17.12.34--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi All:

I just moved my WinAPRS setup onto a new PC due to a hard drive failure on the old one. When I start up WinAPRS, it runs fine, but the font on the message list window is so small I can't read it. The main map windows and all other windows are fine, only the message list window is small. I have tried changing font settings everywhere I can find font settings, to no avail. Can someone tell me where you set the font size for the message window ?

Thanks in advance, 73, and Happy Holidays

This is called the UI FLOOD "FIRST" option which we got Kenwood to add into their digipeater code and are hoping the Kantronics and others will include. BUT, I have to admit, I'm ambivalent about whether it is a good idea to have always ON...

My thoughts are that PATH selection and how the packet is handled should always be at the SENDER's option, not be forced by a digi. That is my biggest objection to the "ID" setting which "changes" the originators intent.   My preference is for NOID so that what the user wants, the user gets:

```
   SHORTEST PACKETS, he should use the path of WIDE3-3
   SOURCE TRACKING,  he should use the path of WIDE,WIDE2-2 (or RELAY...
   TRACE TRACKING,   he should use the path of TRACE3-3
```

So I appreciate the effort to implement FIRST, but it prevents users from using the shortest possible path of just a naked WIDE3-3.

HOWEVER, since I believe that DIGI-NED and your code also support SSID routing, then, and that is even 7 bytes shorter than even the shortest one-hop digi packet. So in that case, the local digi could do "FIRST" modification, because if the user wants the shortest possible path, then he will simply use the SSID method (-SS)...

Just thinking out loud....

But then again, you can do the "FIRST" process on an SSID packet also... Hummh....

Ah HA! How about this for the SSID routing.

SSID ROUTING based on 0-15 SSID''s. Where the SSID is a 4 bit binary number "HHPS"

```
where "HH" are the two HOP bits (0, 1, 2 or 3 hops)
Where "P"  is the priority bit  (0 is routine, 1 is priority)
Where "S"  is the "source" bit.  If "1", then it tells the SSID-Digipeater
    to INSERT the SOURCE Digipeater identification in the digipeated
    packet as you have proposed.  THus
```

```
 WB4APR>APRS:packet is a direct packet
 WB4APR>APRS-1: is a one hop packet
 WB4APR>APRS-3: is a 3 hop packet
 WB4APR>APRS-7: is a 3 hop priority packet
 WB4APR>APRS-11: is a 3 hop packet that arrives as WB4APR>APRS-n,DIGI1*
```

As usual for an SSID packet, the SSID is decremented after each hop. We need nothing higher than 3 hops in a mature APRS system, and if someone needs to use a longer path, then he can use WIDE4-4 or whatever...

I like this, I have wanted to modify the SSID routing system to recover the two "directional routing bits" so that we can have a priority bit, but until now, never had a good idea as to what to do with the 4th bit.

Using it to signal whether we want the FIRST digi identified or not is a good possibility to consider. This is because it leaves the originator in control of his packets, and the digi only does what it is told...

Rendered body type: text/plain

Here's some follow up to my original question:

When I moved the file WinAPRS.prf (a PIC rules file), WinAPRS came up as unregistered and the message list window font was normal size. I moved the file back into the WinAPRS directory, it came up as registered and the message list was teenie tiny again.

Anybody know what's up with this ? Also, didn't you used to be able to see your registration code in the Help, About window ? I'd like to re-install to try that, but don't have my registration code written down anywhere that I can find it. (D'oh !)

Thanks again for any help.

That solved it. Thanks for the help. Also, I solved the issue of the WinAPRS.prf file. Apparently, this is a "preferences" file that WinAPRS generates. Win2K associates anything with a ".prf" extension as being an Internet content ratings file. I changed the association to Notepad and all is well again.

Thanks again.

There is a setting to adjust the font size in maps. Settings menu, then
WinAPRS tab then look in that window on lower right side for Min Font Size.
I think that is what you want.

After serving a year sentence at the shack I learned somthing they do.
When somthing goes on clearance to, theoretically clear out the inventory,
they instantly take it off of the website for some friggin' reason. I am
willing to bet your local store has at least one of these units in stock.
I was checking them out a while back when they went to $79 on sale, almost
bought one. I might just return and pick one up now. Actually, I can get
my hands on commercial Motorola Maxtracs now, so I might just save the 50
clams.

Being a Moto tech is way cool!

Anyone got any *detailed* power info on the etrex base model? Just looked at the garmin PDF and they just tell me to get a special power cable. No word on mAh or mA, or max voltage.

Also, any information on how well (or long in miles) the bread crumb trail works? There don't appear to be any adjustments for distance or time between points... jsut how fast will this unit use up 1500 data points at say, 60mph?

Thanks
Wes

There is a site that has the cables pretty reasonable. I think it is www.pfrank.com. Been a while since I bought from them so might not have the name quite right. I use their cables on my eMap and I think it uses the same one.

G'Day

TAPR have decided to introduce some changes to support those members of
TAPR who are putting time and energy into the various publications that
TAPR puts out each year.

Three Month Membership Extension for Packet Status Register (PSR)
Articles
------------------------------------------------------------------------
--

>From the next issue of PSR, members who have articles published in the
PSR magazine will have their membership of TAPR extended by three
months. It is hoped that this will encourage members to write for the
magazine. The deadline for articles for the next issue of PSR is
mid-January. More information on submitting articles, and on obtaining
copies of the magazine can be found on
http://www.tapr.org/tapr/html/Fpsr.html

Six Month Membership Extension for Digital Communications Conference
(DCC) Articles
------------------------------------------------------------------------
-----------
```

```
>From the 2003 DCC, planned for somewhere in the Eastern USA, TAPR will
be offering Six Month membership extensions for all members who have
papers published in the proceedings. Whilst we would dearly love all
authors of papers to attend the conference, we recognize that there are
reasons that members cannot attend the conference - so the requirement
is only on having your paper published.  This is of course in addition
to the complimentary copy of the DCC proceedings that each author is
entitled to.

We are looking for papers on subject within the bounds of Digital
Communications, as it applies to Ham Radio, on all levels. All you need
is something to say. If you feel that you are unable to write a paper
because you do not have the time, or writing a paper is outside your
area of expertise, please contact me. I will attempt to find someone who
will be able to help you with getting the paper written.

More details on the conference itself will be made available early in
2003, along with a formal call for papers. Until then you can examine
the DCC area of the TAPR www site for details on past conferences by
looking at http://www.tapr.org/dcc/

Wes,

I never investigated the ETrex like that, but I bought my son one for
Christmas a year ago.  NICE little unit.  Very inexpensive, and works
quite well.

As other have mentioned, the connector for the thing is available through
'pfranc'.  Get a COUPLE!  I've made up data and data/power cables
for the thing.  Although I bought a 'real' Garmin power cable for use in
the car for my son.

Just remember, the thing is 3v!!  But there's 3v adapters available for
small tape players.  I forget the 'upper limit' of input voltage, but from
what I understand, it's a pretty hard limit. You go outside the limit,
you damage it.

There was an update since I've gotten it that improved the track.
It had to do with improving memory usage if I remember right.
Thing is, my son lives with his mom, and I haven't played with the
thing since I did the update.  (Just download the update to a PC,
then connect the ETrex and you can do it yourself.)

Mike

Many years ago I set up a Digi in Greensboro, North Carolina (W4GSO) to serve our region and aid in the weather monitoring network. Due to circumstances beyond my control we have lost the Digi site, because of politics, local lack of respect for Amateur Radio or what ever. With a lot of cooperation from Greensboro / Guilford County Emergency Management, county Emergency Services, City and County Communications centers we have a new site so the Digi will survive. Currently it is at a temporary location waiting on the city tower crew to install a new antenna 2nd spot down on a County owned tower. Already the Digi is hearing better than the old site and I am confident when it goes 150 feet higher it will be a lot better than before.
We hope to have everything completed by next week. The Digi has a new call of WX4GSO (same equipment just moved) and is only be a few miles from the original location. Thanks for everyone's support during the transition.

Folks, PLEASE turn OFF the "delivery confirmation" feature in your e-mail programs! There's NO reason to need a confirmation that 500 of us read your message posted to the SIG. If you're sending from a corporate network, try asking your SysAdmin to set you up with a user account that can have this disabled. It's very frustrating!

NO!

It is a totally different product from the classic Street Atlas.

Repeating a post I put on several lists a couple of weeks ago:

Currently, no ham software or APRS programs support or use the new-breed
Delorme products in any way.  The "classic" Street Atlas family is used
dynamically (fluid scroll and zoom in/out) by APRSplus and statically
(capture fixed bitmap images)  by UI-View.

SA9 is the final version of a decade-old design originated in the Win 3.x
era.  It uses a relatively small amount of computer horsepower, and works
well even with machines as modest as a Pentium 166 or 200 MMX.  Since ver 7.0
it has been strictly a Win32 ( i.e. Win9x, ME, 2K, XP) design.  The user
interface uses a "classic" MS-Office-style toolbar across the top of the
screen.  A port of this version is the only Delorme product available in a
Macintosh version.

SA 2003 is the currrent 3rd generation of a line that included SA "Road
Warrior Edition", "SA Deluxe", the Topo USA series, 3D TopoQuads and X-Map.
All of these  are buggy, sluggish, resource-hogging dogs that share a user
interface based on a series of expandable tabs located at the bottom of the
screen.   The user inteface is far more complex and distracting, and less
usable while driving than the earlier one -- especially lacking is the
ability to zoom in or out for a wider view using the cursor pad up and down
arrows. The performance of these programs is intolerably sluggish (in my
opinion) when run on anything less than a P-III 600 or so.

This series includes a lot of hot-dog features such as automatically rotating
the map presentation based on the current heading reported by the GPS so that
"up" on the screen is always the direction you are travelling (not always
NORTH).     [This sounds like a neat idea,  but I found the constant rotating
of the map in city driving incredibly  distracting and disorienting. Not to
mention the even greater strain on Windows resouces struggling to constantly
reproject and redraw the screen! ]    These programs also include rudimentary
voice-command capability which barely works, the ability to actually add new
roads to the program database, split screen displays that can show a
```

steet-level map on half the screen and a wider-view regional context map in the other half that scroll together (SA2003 and TopoUSA Ver 4.0). The second window can also display map data from another source entirely, such as optional satellite 10-meter res photos or USGS topo maps. The more recent products of this family have a multi-layer capability similar to a CAD program that lets you overlay multiple layers of user-supplied data.

The installation of the newer version Delorme products registers dozens of new OCX modules with the Windows operating system, meddles with the TCP/IP functions (they have one of those phone-home-over-the-Internet-for-registration-and-updates features), overwrite several shared system file with supposedly newer ones. I have had numerous system stability and random browser crashing problems after installing these newer versions.

The only one of the "new-breed" programs I use is TopoUSA 3.0 (Topo 1 and 2 were absolute performance dogs and Topo 4 was so buggy I returned it to Delorme for a refund.)

In addition there are just plain errors in the install routine -- some paths for components to be installed are HARD CODED to C:\WINDOWS. If you have Win 9x on a drive other than C: or use NT/2K/XP where the system directory is named WINNT instead, the GPS components will fail to install. [Unless you want to locate and hand-edit an incorrect batch file in the program directory and re-run it. That's right, these Win32 applications actually use a DOS batch file as part of their install!!] I have tried to notify Delorme about this for over three years and STILL new releases continue to have this flaw.

All programs old and new utilize the same GPS handler and work with the same range of GPS devices (Delorme Earthmate proprietary, generical NMEA, and a variety of Garmins and Magellans) and produce the same green arrow "bread crumb" tracks overlaid on the map.

Rendered body type: text/plain

Needed a Garmin Cable WITH power (tonight!)
One in the box is DB-9 but 3 wire and no power.
So drilled out the power pin from the back
Put in a pin from an old DB-25 and ran the 4th wire down the cable
    a few feet where I dug into the cable to get the ground and
    then spliced in a cigarette adapter.
A dab of glue to hold the pin in place, and bingo, turned a useless cable into something useful.

Trick is drilling through the back of the plug to where you just hit the back of the pin. Then use something to push the old pin out through the back for a clean hole all the way through..

Your millage will vary. P.S. It wasnt my cable, so I could take the risk <grin>

I fired of a 'hot' note to Delorme after installing 2003... I have used SA almost since
day one and 2003 is truly a dog. I have it on my desktop but it will never see the
read-write heads on my laptop... It is also the last Delorme product I intend to buy and I
have bought almost all of them through the years...

(We travel across the USA quite a bit and have depended on SA for a couple of hundred
thousand miles.)

It's too quiet here.

At 05:56 PM 12/3/02 -0500, Bob Bruninga wrote:

>My thoughts are that PATH selection and how the packet is handled should
>always be at the SENDER's option, not be forced by a digi.

Let's take this a step more towards the generic which is hopefully both
easier to use and more efficient in the network.

If the Sender wants to force a packet up the network from DigiA to DigiB to
DigiC - then it's easy to hard code that path.

If the user wants to hard code the path to take 3 hops, then that's what they
get with FIRST or NOID routing.

>   SHORTEST PACKETS, he should use the path of WIDE3-3
>   SOURCE TRACKING, he should use the path of WIDE,WIDE2-2 (or RELAY...
>   TRACE TRACKING,   he should use the path of TRACE3-3

Right. But in defense of FIRST routing, once it's been heard at the DIGI, then it doesn't matter near as much. The packet has entered the system and that's the hard part where saving the 8 bytes might make a difference. Adding 8 bytes to the packet after it's bouncing from WIDE to WIDE isn't going to make much difference. After all, all the WIDE digi's are already optimized proper deviation and minimum TXDelay, etc. (right? :-))

>So I appreciate the effort to implement FIRST, but it prevents users from
>using the shortest possible path of just a naked WIDE3-3.
>
>HOWEVER, since I believe that DIGI-NED and your code also support SSID
>routing, then, and that is even 7 bytes shorter than even the shortest
>one-hop digi packet. So in that case, the local digi could do "FIRST"
>modification, because if the user wants the shortest possible path, then
>he will simply use the SSID method (-SS)...

Now that I have a second PIC-E and I'm playing with the configurations, I'm going to give this a try.

>Ah HA! How about this for the SSID routing.

Too complicated...   This is a really good thing we don't want accidentally turned off.

>SSID ROUTING based on 0-15 SSID''s. Where the SSID is a 4 bit binary
>number "HHPS"
>
>where "HH" are the two HOP bits (0, 1, 2 or 3 hops)
>Where "P" is the priority bit (0 is routine, 1 is priority)
>Where "S" is the "source" bit. If "1", then it tells the SSID-Digipeater
>   to INSERT the SOURCE Digipeater identification in the digipeated
>   packet as you have proposed. THus

Network level functions, like the S bit, is a don't care to the user.   SOURCE Digipeater identification is a good thing for the network. Users don't need to worry about it when setting up their configuration.   It only complicates things.

>As usual for an SSID packet, the SSID is decremented after each hop.
>We need nothing higher than 3 hops in a mature APRS system, and if someone
>needs to use a longer path, then he can use WIDE4-4 or whatever...

AMEN!

>I like this, I have wanted to modify the SSID routing system to recover
>the two "directional routing bits" so that we can have a priority bit, but
>until now, never had a good idea as to what to do with the 4th bit.

I'd much rather see adoption of a LOGICAL PATH flag.   This is a carry on of the LOCAL, REGION, WORLD, IGATE paths we've discussed.

```
   WA7NWP>APZ999-12 - goes to LOCAL
   WA7NWP->APZ999-13 - goes to REGION
   WA7NWP->APZ999-14 - goes to WORLD
   WA7NWP->APZ999-15 - goes to the nearest IGATE
```

The smart digipeaters like DIGI-NED would see those and regenerate packets with the appropriate path.   In my local setup that would be:

```
   WA7NWP->APZ999-12 - resent as:  WA7NWP>APZ-12,REDMND*:
   WA7NWP->APZ999-13 - resent as:  WA7NWP->APZ-12,REDMND*,WIDE
   WA7NWP->APZ999-14 - resent as:  WA7NWP->APZ-12,REDMND*,WIDE3-2
   WA7NWP->APZ999-15 - not digipeated.  REDMND is an IGATE
```

Other systems in other communities could have totally different path definitions.

>Using it to signal whether we want the FIRST digi identified or not is a
>good possibility to consider. This is because it leaves the originator in
>control of his packets, and the digi only does what it is told...

Again, I believe the user can use explicit paths if necessary and desired. Network paths are open to the local definition of the network.   That's what will make this work well in all regions.   A user configuration won't change - the locals can tweak operation for their unique conditions.

73,
Bill - WA7NWP

90. [aprssig] Re: etrex stats + bonus

From: "Wes Johnston" <wes@johnston.net>
Date: Wed, 4 Dec 2002 20:24:25 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-109630-2002.12.04-20.09.39--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Some bits and pieces and what I learned today...

yellow etrex draws 130ma at 3v

The backlight won't go out if powered from external power, on internal batteries, the backlight times out after a few seconds.

max voltage is 3.25, but I'm guessing 3.3 will work.

MAX604 is a maxim low dropout regulator that will supply 3.3volts and has a pin labled NOToff. Making this pin high will cause the regulator to come on. The current consumed by this pin is like 10uA.

rpelectronics.com has a vibration detector (p/n ss-040) which is nothing more than a weight (pendulum) on a springy steel arm for $4, and a resetable timer for $12 or $15 (p/n uk197).

Here's the plan...

Supply power to my dumb NMEA tracker all the time via the vibration switch and resettable timer and a relay. When the car moves, the timer comes on for 5 minutes or more. When the car is parked, the timer shuts down the radio on a large power relay.

How's that for stopping a tracker from beaconing all day?

Works, but it's somewhat more complicated than a programmed micro watching the NMEA stream and pulling the plug if speed <1MPH for >10 mins. (or some other programmable parameter)

How about setting up two strings in a KPC-3+ so that one beacons at a fast rate when movement is sensed, and then reducing the rate when the car is not moving.

96. [aprssig] Small 12 Volt LCD Monitor

From: "Mark Fellhauer" <sparkfel@qwest.net>
Date: Wed, 04 Dec 2002 23:44:51 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-109678-2002.12.05-00.41.44--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I was at Best Buy tonight and saw that they have a 10.4" LCD TV/SVGA
Monitor for $500.00.

http://www.bestbuy.com/detail.asp?e=11169469&m=1&cat=24&scat=1222

350 nits
Contrast Ratio - 250:1
12 volts
181 Channel Cable Tuner
S-Video Input
Composite Input
SVGA Input

We're getting very close to an affordable LCD SVGA display for automotive
use. But not yet.
I also think that you're only going to get acceptable daylight viewing when
you get into the 1200 nits range.
But this would be good for a Van/RV/Boat

TV option would make a good ATV receiver...

Regards,

Mark

No! It's different! eTrex (and eMap) have a small connector with 4 contacts
in line, other Garmin units have a round 4-pole connector (with or without
hole in the middle (for units that don't accept 12 V).

Wes Johnston wrote:

> How's that for stopping a tracker from beaconing all day?

Way cool, Wes!

Another way is to check your fuel pump relay for unused contacts and use those to turn on your tracker. If no contacts available, use a voltage sensing circuit to determine if the fuel pump relay is being engaged and have that circuit turn on your tracker. Of course, if the vehicle gets towed it wouldn't work. It would with your method. Hmmmm. Perhaps the gear sensor or parking brake sensor (just switches) may open up opportunities. :)

A favorite of mine is to have the tracker in the car when I drop it off at the shop. When the guys are done working on it (really happened with my wife's car), they test drove it. I just watched for the tracker to activate, and knew they were done. Kinda suprized them.

This brings to light the suggestion made months ago about tieing the brake light into your tracker. Since most people hit the brakes when they turn (because they have automatic transmissions), the brake light would cause the tracker to transmit. Wonder if this could be used with a tiny trak mode change... have mode 1 set for 3 minute intervals, and mode 2 set for 10 second intervals. The brake lights change the mode from 1 to 2.

Of course this is way off from where I started... a tracker which draws zero
power when parked, but closer to aprs than radio shack.... lol.

Wes

I am watching for the ~$350.00 price on these devices exactly for ATV use.
There are TV devices with SVGA in, and computer devices with TV tuners. It
will be interesting to see which camp gets to the price first!

The default is not sendin' receipts
to lists.

I have the receipts for others set.
That way I know a message got
through and no need to resend.

Interesting; my version of OE it takes a deliberate action,under the tools menu, to send receipt request. Anyway I can't recall very many coming from posts to aprssig.--73

108. [aprssig] The AAG weather station with the T-238

From: "Mike Yetsko" <myetsko@insydesw.com>
Date: Thu, 5 Dec 2002 11:54:25 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-109716-2002.12.05-11.41.04--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I just received 3 of the AAG weather stations for use with a software product I'm working on.

Nice! Seems to be even a bit better than the original DS unit I have on the roof hooked to my T-238.

But...

It's different. Now version 3.0, it no longer has the 8 addressable switches, and there are other changes to the circuitry. (It uses a 4-channel A/D circuit to detect wind direction.)

Oh, it appears better. Lower power too.

But not the same.

Anyone start working on the T-238 code yet to support it?

Mike

>
> - Rich

Unless I missed something, the latest code there is 1.13.01. The AAG units changed to version 3.0 sometime well after that. The new units are NOT COMPATIBLE with the original DS units. They do not use the 8 sensors for wind direction. I see no mention of that on any of the pages on the page you sent me to.

Mike

Hello Bill,

At 12:46 3-12-02 -0800, Bill Vodall - WA7NWP wrote:
>Speaking of which...   I dropped a note on the Digi_ned tech forum a couple
>days ago and didn't get an answer yet.

Sorry, to be honest, I don't look there very often. Most of the time Remko,
PE1MEW, catches the message (he gets mail when somebody posts a message)
but I know he is very busy since he changed his job a few months ago.

>So, the digi_ned question is: Is there a way to catch a packet like the above,
>only if it's the "first-digi", and drop in the digi_ned system call.
>
>The packet would be rewritten from:
>
>WA7NWP>APZ,WIDE7-7: stuff
>
>to
>
>WA7NWP>APZ,REDMND,WIDE7-6: stuff

I see. I don't think it can be done today sinc digi_ned cannot see the
difference between WIDE7-7 at the start of the list or WIDE7-7 further in
the via list. So if you change the rules then all WIDE7-7's will be
digipeated with the additional call.

I will look into this. I was busy to make a release a new version, maybe I
```

can just hold it for a moment and add the possibility to do this.

I'm thinking of something like:

digifirst:

That behaves like "digipeat:" but only accepts the packet if a match is found with the digipeater that is due and is the first digipeater in the via list and

diginext:

That behaves like "digipeat:" but only accepts the packet if a match is found with the digipeater that is due and is *not* the first digipeater in the via list.

So the now existing rule:

```
digipeat: all wide7-7 all swap0 wide7-6
```

can be replace with:

```
digifirst: all trace7-7 all swap REDMND,trace7-6
diginext: all wide7-7 all swap0 wide7-6
```

I think that would solve your puzzle. I will have a go at it, hopefully we can still have it in the next version (DIGI_NED 0.3.3).

Kind regards,

Henk.

I am looking at building Baycom type modems to use on a Linux computer. I find the modem chips difficult to get. Has anyone any suggestions for alternate hardware? I've seen a design using the XR2206/XR2211 for mod and demod, any thoughts on that?

Thanks,
Adi

A number of people have used the T238 with the most recent version of the
firmware on the web page below and the latest weather station from AAG and
have reported no problems. Station W0DVW near Divide, Colorado is one of
them. You can check that data and contact the builder, Scott, here

Map drawing is a bit slow but otherwise DOSAPRS works great on an HP-100LX. A compact flash ram disk makes it a good little system. JNOS is another packet program that works well on the HP-100.

Hi there,

I know I had a sticker for the bottom of a magmount antenna, but lost it in the move (just like a soldering iron, which I found after I bought a new one....figures!). I'm not sure there's anything special about those magmount stickers, so I wonder if it is possible to use regular stickers (perhaps the mylar kind?). Does anyone have experience with using regular
stickers for the bottom of a magmount?

Thanks and 73,

I have been know to use regular old clear box tape to cover the bottom. All that sticker is for is to protect the roof of your car.

Morning All,
Found a neat website that has some chest packs that might be of interest to
the APRS community for holding all of your gear if running aprs mobile.

http://www.thielsen.net/cgi-bin/store/commerce.cgi?product=rg

Looks like there area few that will hold multiple radios plus GPS and phone
all at once.

Just some information for the group.

Doesn't that get a little hot during the summer? I had a operation during
the fourth of July event that even a t-shirt was hot would a vest or jacket
be the same way? The chest pack would at least a way to not have an extra
layer on for the hot season.
Just a thought.

How many batteries fit in the unit. 2? then 3v is max. 4? then 6v. 6? then 12 would be the max that I would try. A car cord with a 12v regulator probably would work but not a direct connect since the auto system usually runs in the area of 14v.

The Garmin 12 has four AA batteries, that gives you 6VDC but the actual
cable from Garmin or blue hills innovation is marked at 8VDC.

The manual should tell you how much voltage it will take on the input.

Garmin has a standard with the center pin of the four pin connector, if it's present, it's low voltage and if it's missing it's high voltage. I don't remember the limits offhand though.

I would never make the mistake of judging the input voltage of an electronic device (on it's external power input) by the number of the batteries it takes. Sometimes this works and sometimes it doesn't. And sometimes small consumer electronics use AC external power adapters. I know we're talking about Garmin here - and they don't, but...

Garmin is very good about publishing current and voltage requirements for their products, so they've done the experimenting for you.

73,

Mark

Many of the Garmin's work on 6v -> 36v, This is because of the
Marine/boating world that they started in. The voltage on boats is
much more variable than in cars.

I think that the units with the ROUND 4 pin connector will work on
the wide range of voltage, but the eTres serious probably won't.

PLEASE check your manuals before actually trying this

In this case, read the 'specs'.

The ETrex models all use just 2 AA batteries. I don't know what the
max is on the unit, since I never looked into it, (my son has the car
adapter from Garmin) but I seem to recall it is marginally above
3V for external input. I do NOT believe ANY of the ETrex models
are 'regulated'.

Typically, with the other units that use 4 x AAcells, there are two
variants.
One is the 'unregulated' versions. Mostly older, but the GPS12 is an
unregulated version. They take 6v or so on the input, and somewhere
above 8 or so volts and they turn to smoking ruins. It is rated to run
anywhere from 5v-8v.

The GPS12CX on the other hand, like the GPS-II+ and GPS-III (newer
and older variants) also use 4xAAcells. But they are REGULATED,
and are rated to accept an external power input of from 10v to 32v.

The number of batteries has nothing to do with it if the unit is
'regulated'.
The unregulated Garmin units that accept the round connector have a
center pin if they are unregulated. Power cords that provide over 8v
Will have a solid block in the center of the connector. That way you
cannot plug the 'high voltage' adapters into the unregulated units and
destroy them. Power cords that regulate down to 6V will have a hole
in the center of the connector to fit around the pin...

Mike

The Garmin 12 will take 6V (if I remember correctly) and smoke with 12V
input. There is a Garmin 12XL which may have a voltage regulator built in
in take a higher input voltage.

There are some with the round connector that are low voltage.
IIRC, they have an extra pin in the center that prevents the 12V cables from being plugged in.

Rendered body type: text/plain

I really hate to do this to a fellow APRS'er, but I'm at wit's end.

I would like to recommend avoiding doing any kind of personal trade/sell/swap transaction through the Internet/Mail with James R. Duncan, KUOG, of Warrensburg, MO and a longtime contributing member of this SIG.

In April, I listed a few laptops for sale here and Jim contacted me interested in buying one. He told me that he couldn't pay for it right away, but if I'd send it to him, he'd get me payment within 20 days. I know this sounds stupid, but I've done business with Jim in the past, and based on our longtime personal exchange of email, I went ahead and sent him the laptop.

Since then, I have suffered through him avoiding me for some 6 weeks off the bat. And finally when he did respond to my inquiries about payment, he promised he would pay me in full, on the following 15th of the month. He's been doing that for 5 or 6 months now. I even gave him the option of paying a little at a time...but that hasn't happened. Jim has never complained that the laptop didn't meet his expectations nor did he ask to return it. In May or June I would've gladly taken it back with no hard feelings.

In September Jim mailed me two post-dated personal checks, each for half the sale price. The first check was returned to me for NSF. Jim emailed me and asked me to redeposit the check, and again it came back NSF, and this time the bank punched out the routing numbers on that check. It was obvious to me depositing the second check was a waste of my time. But it shows that Jim has propensity to commit criminal acts, that is, Check Fraud.

If you recall, Jim's truck was stolen (and recovered) in late October/early November, and I emailed him once again, commenting of the fact that he's driving a 1999 SUV, with a Kenwood APRS transceiver in it. It seems to me Jim has the assets to pay me if he really cared to. He once again replied that he'd pay me shortly after November 15, and we are now at December 6 with no payment. My least email to Jim 3 days ago, inquiring about payment and notifying him that I'm pending legal action has gone unanswered.

I would like to add that the total sale price of said laptop is less than $500, and that I was merely acting as an agent in this sale. The laptop is owned by a client of mine, and this has put me in a very awkward position with him.

I'm in the process about seeing what legal action I can take against Jim. It is with a heavy heart that I'm forced to do this, but I thought everyone here should know. Please send any comments on this subject to me OFF-SIG. It is not my intention for this to become a long off-topic thread.

Regards,

Mark Fellhauer

Since Mr. Fellauer has chosen to make a personal business transaction public, I will add a few comments on facts which he selectively omitted from his post to the SIG earlier.

Mr. Fellauer offered to ship the laptop and accept payment at a later date when it would be possible for me to pay for this item. Since this matter has been taken public in this manner, I am forced to publicly acknowledge that I was diagnosed with colon cancer in late May and spent the months of June, July and August undergoing treatment and surgical procedures to deal with this. I did not wish to let this go public, however, it is now necessary. As a result of removal of the polyps and subsequent chemotherapy, I have been given a semi-clean bill of health with the caveat that I will have to be closely monitored for the next 24 months to ensure that there is no recurrence.

Since I did NOT have health insurance at the time, this took a significant toll on my financial resources. Only through the assistance of my family have I been able to stay afloat and try to meet my financial obligations to the doctors and hospital while trying to keep up with current expenses as well.

Yes, my first check to Mr. Fellauer did get returned insufficient funds and that is a fact that I will NOT deny however it was NEVER my intent to defraud Mr. Fellauer in any way, shape, or form and I have repeatedly attempted to arrange to take care of this matter with Mr. Fellauer which have also gone unanswered.

I have forwarded another proposal to Mr. Fellauer, the details of which are personal and confidential, to attempt once again to settle this matter amicably. It is my hope that Mr. Fellauer will respond positively and that this whole mess will be resolved within the next week.

Jim Duncan, KU0G

No no, put your proposal here on the SIG so we all can see it and bask in its glory.

Yes.

http://www.cmlmicro.com/products/Datasheets/Docs/db614-4.pdf

>weren't they bought out by somebody???

No, the parent company of MX-COM was CML Micro, and they just adopted their
name. They did loose a really good tech support guy at that time however.

139. [aprssig] APRN the best setup

From: "Michael J. Wolthuis" <wolthui3@msu.edu>
Date: Fri, 6 Dec 2002 23:58:49 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-109873-2002.12.06-23.45.44--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Everyone,
I read a long time ago Bob Bruninga's (WB4APR) proposal on APRN and from
what I can tell it never took off to much, but I am sure some people are
using the idea or something similar.
Today I got my hands on a Kenwood VC-H1 and want to install it with my
day to day Kenwood d700a tracker with GPS. However, I am not sure how
the best way to make this work is, so here is what I want, and I am
looking for some ways to do this:

1)Images to be sent at timed intervals from the camera mounted in the
car
2)Most recent image to be displayed on my webpage (I assume this will
take an additional SSTV receiver setup of some kind)
3)Storage of images captured

What I am not sure of is can you send the SSTV image say every 5minutes
on 144.390 without disrupting the APRS traffic greatly? If not can you
use band B on the d700a on a secondary frequency for SSTV while still
having APRS on band A?

If anyone has any good webpages or info on this please let me know, I
think this can be very interesting add-on to tracking, but I need to
figure out how to do it all.

Thanks,
Mike Wolthuis

> What I am not sure of is can you send the SSTV image say every 5minutes
> on 144.390 without disrupting the APRS traffic greatly?

NO!!!!

Furthermore, the VC-H1 is almost impossbile to mode switch into the auto-beacon mode without an external software application controlling it. [I have often wished for a convenient way to do this without a computer controlling it for use with my "Mobile LiveCAM" while driving cross country.]

> If not can you
> use band B on the d700a on a secondary frequency for SSTV while still
> having APRS on band A?

The APRN concept is similar to Mic-E APRS-burst-after-voice transmission -- The APRS data burst is completely separate from the SSTV transmission that precedes it. Both are transmitted on the same frequency, and are normally conducted on a non-APRS frequency.

At the fixed station:
Basically, you feed the base station receiver audio into BOTH a TNC connected to a standard APRS mappping application AND into the computer sound card connected to an SSTV reception application. [Any of the standard soundcard SSTV apps that can automatically save a received image into a JPG file can be used. The freeware mmSSTV works very well for this application.]

[Of course the big-bucks luxo approach to this would be to use a D700 at the fixed station as well. The internal TNC could decode the APRS burst and the sound card interface can be connected to the 6-pin mini-DIN "External TNC" connector on the D700. [This connector is actually just RX audio, TX audio and PTT suitable for external TNCs, soundcard interfaces, repeater controllers, etc. In the mobile you are probably using this port to connect the VC-H1 which again, like any SSTV device need RX audio, TX audio and PTT keying.]

The complexity comes after that. A third program then has to:
1) Monitor for the appearance of a new JPG image file.
2) Screen cap the APRS map image into a file when a new SSTV image is detected
3) Assemble the two images above into an HTML page.
4) FTP the HTML page and two images to a web site.

Other random considerations:
The VC-H1 powers up defaulted to the Robot 36 transmission mode. Unless it hears some other mode on receive, it is stuck in this mode, unless an external computer controller commands it into another mode. While R36 is great for CQing (it's the shortest transmission time of any SSTV mode outside of the classic 8-second B&W mode SSTV started with 30 years ago), the resolution and image quality leaves a lot to be desired. If you want to transmit scenics and other complex images, the unit will need to be commanded into a higher quality mode such as the very popular Scottie 2 mode (90 seconds transmission time).

The VC-H1's internal firmware is HORRENDOUSLY BUGGY. Once the device switches into Scottie2, it will not transmit more than 4 or 5 times without locking up and crashing. You then have to cycle the power off and back on which makes it reset to Robot 36!

The provided camera head on the VC-H1 is really awful. It's a low-res fixed-focus CCD imager similar to the ones in X10 spycams or home security CCTV systems. The field of view is excessively wide angle (equivalent of about a 30mm lens on a 35 SLR) which further aggravates the resolution problem since most subjects show up far too small in the image. You can remove the camera head and expose a 3.5mm stereo mini-jack. Plug in an external NTSC image source The image quality will be about 1000% better.
[I have used some ot the original Kodak 640x480 digicams with 3:1 optical zoom lenses that ranged from 35-100MM equivalent very successfully for this purpose. These are often available second-hand very cheaply since the outbreak of "megapixel mania" in the digicam market. Since all the standard SSTV modes that the VC-H1 transmits are 320x240 pixels, such a

camera has more than enough resolution.]

The url is http://www.scottevest.com/

We looked at this - and found it got some very negative comments in
reference to usability - it's really aimed at the MP3 / CD lister
(technogeek?) rather than the emcomm person.

Our biggest issue was that its entirely inappropriate for most of our emcomm
work when the temperature is over 110 degrees and the circumstances call for
Nomex wildland fire clothing.

Personally, I feel that the thielson equipment is 'workwear' and the
scottevest is a fashion garment.

I frequently wear a tactical load-bearing vest built by Q-Systems in
Arlington, TX. The vests are extremely expensive (mine, without any
ballistic paneling, was over $400) but are incredibly durable,

custom-manufactured, and are made out of a nice, breathable mesh. The company provides tactical vests and other custom law enforcement attire to agencies across the country.

I have no trouble carrying a Motorola HT-1550XLS on VHF, a Motorola Saber 2 Ruggedized on UHF, a Motorola MTX8000 800MHz trunking radio, and an Ericsson LPE-200 EDACS radio, along with two flashlights (a Sure-Fire for normal operations and a red Pelican light for a tactical light), a battery pack, and two pockets full of whatever accessories I might need for the current assignment (tools, spare tactical knife, battery packs, power cabling, etc.) My configuration, fully loaded, can weigh upwards of 30 lbs.- however, I've worn the thing for 16-18 hrs. at a time with no discomfort as I have experienced with other vests. The main key is to balance the load as evenly as possible across your body when building the vest.

73s,
Terry

Duct tape works good, but if you use a sticker, it needs to be vynil not paper based.

Hi All
           Another idea is to check out the fanny pack that Radio Shack sells.
Yes it is designed to hold a cell phone.

It has a pocket that holds my Thd-7 very well.
It has the regular fanny pack zippered pocket.
It has the same size fanny pack zippered pocket on the reverse side.
        (The side that is up against your body)
It has a smaller fanny pack type zippered pocket.
And it has another smaller fanny type zippered pocket.

As I remember it cost was $9.00 or so. If you do not see the
pack in the store ask for the cell phone fanny pack.

Let us hope we never witness the "Silence Of The Hams"

> 4)  FTP the HTML page and two images to a web site.

The Program APRN does just that.  However it creates a new page each time
```

Without deleting the old one. I wrote a little utility that would watch a directory
for a new file to appear.   This file can be anything you select but does require you
to specify the name of it in advance. Then it will upload it to your Website. It
should support all of the Inet transfer protocols although all be the FTP is untested.
After it uploads the file it erases the local file and waits for it to reappear.

I have often thought about doing the same thing with SSTV only using 440 and
making a separate station to handle the traffic for it. But I could never find all
the peace's to make it work. But will keep working on it. In light of this tread
I will look into the way SSTV software saves the pictures and maybe adjust my
little program to work with it. ;-)

> Wouldn't the modem chip TARP is using in the Pic Encoder work in this app?
>
> MX614??? if memory serves me??? weren't they bought out by somebody???

Yes, one of the alternatives to the original modem chip is the MX614.
There aren't many suppliers out there. Found 2. The first one has a large
minimum quantity. Still waiting for a reply on pricing, shipping and min
order from the second. Unfortunately both distributors have only the MX614
which is of interest to me and nothing else.

Makes me wonder sometimes if it wouldn't be worthwhile going into online
business selling electronic parts in small quantities. Lately i find most
of my project come to a grinding halt when I can't get the parts I need at
a reasonable price. Having to buy 25 Pcs of a $6.50 part is unreasonable,
IMHO, if I am building only a couple of devices...

I am looking/hoping for a design using some more readily available parts.
There is a design using a XR2211/XR2206 combo. Has anyone used that one? I
need hardware DCD with an always open squelch, so the XR2211 is needed
even with a MX614 modem, I think.

I plan on running 3 TNC's on the same computer. Soundcard is out in this
arrangement. The whole things needs to run with an open squelch, too.

My idea is to have a single site that uses the MIC-E idea on an IRLP
node/repeater, digipeater on the APRS frequency, internet gating and APRS
sat gating. This will require at least 3 TNC's and the MIC-E TNC will have
to provide reliable DCD with an open squelch and voice on the same freq.

This brings up a question - I don't have the VC-H1 software that Kenwood
sells but I've read that it's a great example of how not to design user
interfaces, to put it charitably. Has anyone ever seen any other software
to interface with the VC-H1?

If you are only going to be using the XR2211 modem on AFSK packet,
there is a much simpler modification to the DCD circuitry which works
quite well:

ftp://tapr.org/software_lib/tnc/dcd_mod.txt

You will also need the TNC-2 schematic:

ftp://tapr.org/software_lib/tnc/tnc2sch.pdf.

Symek used a 2211 for the DCD in its TNC-2S, which had a TCM3105 for
the demodulator.

Why? I've used the soundcard packet drivers on Windows, and know they can use
multiple channels/multiple soundcards, and reading the HowTo for Linux, such
appears to be the case here as well.

>The whole things needs to run with an open squelch, too.

Then the MX614 will not work as it is a telephone modem. The Exar parts you
mentioned can be modified for open squelch, that might be a good candidate if
you are looking for hardware DCD. I'm also fairly sure the soundcard packet
modems do have a "open squelch" software DCD in them as well (but not 100%
sure in the linux case). Wouldn't suprise me if the Baycom's did also.

If it was me, I'd just go to a ham swap and buy 3 used MFJ-1270's for average
price of under $50 each. They have the Exar chipset in them and can be easily
modified for hardware DCD (open squelch). I even think the UI-DIGI software
has a KISS passthrough function so your site could function as a stand-alone
digi even with the computer off.

Sounds interesting what you are trying to do.

Ouch.... I missed that part. You'll need to OR/NOR together the open squelch DCD as well as a logic output of a noise gate. Noise gate detects high frequency noise just like a squelch does. Actually, you could use the squelch decision as your noise gate logic, but tap the audio before the squelch circuit.

Here is the logic.

DCD output goes to OR gate
NoiseGate logic output goes to inverter, then OR gate

Output of OR gate represents DATA present or carrier present.

Actually, since DATA assumes a carrier, you could simplify this and just use the output of the squelch decision as your DCD, just taping the audio before the squelch circuit.

An older radio might make all this happening easier.

Hello all,

Has anyone been successful in connecting a Icom W32A radio to a computer for use with the soundcard? the laptop has two comports and one has the GPS connected to it. And still be able to run APRS w/ the soundcard? This isn't my equipment it is just a question I had posed to me. Any help or Enlightenment would be much appreciated.

TIA,

I don't think there is any.
I would agree, it's thoroughly excerable.

I think, for APRN to work, the station ID and position need to be in the SSTV data.  Otherwise, you're
making a large assumption that the position packet and picture are related.

Chromapix talks about a "caller ID" feature, apparently some sort of low data rate encoding before the
picture is sent. I haven't been able to find any information on it though.

I've been using two of the VC-H1s, and a Tasco converter here, with chromapix, for skywarn.  It's SO
nice to get radar updates in the field.

A Garmin eTrex would probably be a good choice.  No map display but does
keep waypoints so you can always find your way back.  :))

I use the Garmin eMap which has roads and other things.  It also has
waypoints and other nice features for use when not out hunting.

I think both will run 12-16 hrs on one set of AA batteries so keeping a
spare set while waiting for that 10 pointer is not a problem.

I am sure that there are many other good choices but those are the ones I
have had experience with.  I use an eMap in the car and it runs 24/7.  Only
problem I have had is that when it gets REAL cold, it auto shuts off.

How cold is real cold? My sister-in-law thinks 45 degrees is real cold.   A few days ago in Sioux Falls, my winterized windshield washer fluid froze (I have switched from winterized to Arctic).   I think that was about minus 6 degrees Fahrenheit. I had to put cardboard in front of my radiator to get the heater to work...

I don't consider minus 6 to be real cold.   Minus 20 is real cold to me... ;)

APRS is a concept for uplinking live SSTV images from mobiles, to a SSTV receiver for direct aving to a WEB page for instant access by anyone with a browser. It was never intended to do the SSTV uplinnk on APRS. The uplink takes place on a local simplex or repeater. APRS is only used to send a single STATUS packet to identify the SOURCE, and LOCATION of the image for futuer automatic reference by the web page.

See the APRN idea web page.

http://www.ew.usna.edu/~bruninga/aprn.html

But glad to see someone is thinking on persuing these concepts. They are very powerful...

Then there's the DCD add-on for MX614 type modems. From what I've learned so far, I gather my best choice would be to use the MX614 modulator/demodulator with the XR2211 to do the squelch.

> If it was me, I'd just go to a ham swap and buy 3 used MFJ-1270's for average

There aren't too many opportunities where I live to get my hands on used gear, unfortunately. I've looked at ebay, but used TNC's go there for near US$100, plus shipping (for each), exchange rate (to Canadian $$$), this becomes expensive.

If this was for a standalone digipeater or gating aprs from a voice repeater to aprs frequency, I'd certainly go with a proper TNC. However, since there's already a PC at the site for internet gating, I figure building some Baycom type TNC's would be an economical and practical route.

I understand digined does multiple TNC's and there's a way to pass packets between digined and aprsd running on the same box. So far that's what I have in mind...

> Sounds interesting what you are trying to do.

Yup, been playing with these thoughts for a while but work has kept me too busy to think much about it. Things are getting quieter now and I hope to have enough time to see this come to reality soon. I am hoping to have all the parts on hand to build a prototype TNC between Christmas and New Years.

I'm currently working on some APRN stuff. Humble though they may be, here are my thoughts.

I installed soundmodem. It is capable of decoding the packets. I have also compiled but not yet tested or configured the AX.25 application WAMPES.
I put an extra sound card in my UNIX box. I also installed OSS drivers. They have the option of splitting the /dev/dsp output into multiple output streams.
So I can connect the QSSTV application to one virtual device and the Soundmodem to the other virtual device. I also got QSSTV to compile. It receives pictures ok, but doesn't send them. Although sending pictures isn't nessasary for this application, I would still like to have that capability. This is as far as I have physically gotten.

Future steps are:

A script, probably perl, will listen for messages sent to my station. When it hears a message like "SSTV 146.55 Scottie2", it will change the frequency of my radio to 146.55, and set a unix "lock", and set QSSTV to Scottie2 and respond with "SSTV receive ready". I should be able to do this with AX.25 ports and it wouldn't interfere with Xastir. In theory.
The mobile station could then send the picture (on 146.55) with the appropriate tag on the end. My station would probably respond with the ack message. (on the APRS freq) The spool lock on the radio could then be released and the radio retuned to the PCSAT d/l frequncy, or any other frequency for that matter.

The perl script would take off the tag and store it in (probably) a mySQL database along with the filename and location of the picture file.
The database could be searched and any picture displayed along with the location of the sending station. This could be done ala "Findu style". Where the maps aren't stored picture files, but generated on the fly from information stored in a database. And the sent SSTV picture is displayed underneath the map.

Take care, 73

Well here just south of Louisville KY, I think 20 is cold. Then again I spent most of my life in NW Indiana and western suburb of Chicago so up there, -20 was cold.

Personally, anything below 70 is too cold for me. Would have moved further south but wanted to be within 4-5 hr drive from my daughter and grandsons. For them, a little cold is acceptable.

When it gets below 20 the eMap shuts down most of the time. My Yaesu FT-8500 does the same thing and won't stay up until the car gets about 50.

I'd say the basic ETrex fits the bill.  However, having a BRIGHT yellow
box to flash around isn't too cool when you're in camo.  So, Garmin
sells a 'camo' version, with a few more features.  Go to www.garmin.com
and check them out.

I have a number of units, a GPS-II+, a GPS-III, and a DeLorme unit.
I bought my son the basic ETrex when it first came out.  The II+
and the III would be WAY too clunky for hunting use.  The ETrex
might just fit the bill.

A friend found a 'flashlight' holder with a velcro flap.  He fastened
that to his sling, so the unit is 'almost' on his shoulder.  Works great
in the woods in that position.

Mike

I bought a II+ (black case) back when the 12XL couldn't do 20+ hours
on a set of batteries.  The II+ could.  Sometime after that they
upgraded the hardware in the 12XL and it was less power-hungry.  I've
bowhunted with the II+ for a number of years now and have been very
happy with it.  Once nice feature is that the rotatable antenna can
more easily pick up the sats when in a shirt pocket or sleeve pocket
on my jacket.  The units with the antenna built-in need to be
oriented horizonatally to pick up well.  The II+ can be oriented
either way.  I can use it vertically in my hand or horizontally in a
car equally well.

I typically leave my GPS antenna folded down with the GPS off an in
my under-the-knee pocket until I need a fix.  Then I figure out a
direction to go, set my compass to that bearing, put the GPS away,
and start walking.

Yea, I'm always a bit worried about breaking off the antenna, but so
far I've always been able to put my body between the GPS and any hard
objects on the ground.  ouch!  Oh yea, an IC-2AT case hurts a lot
more to fall on than the ground itself.  Found that out one muddy
```

year, several times...

I also think that having upload/download capability for waypoints is
a wonderful thing for hunting. I keep adding to my list each year
and it's nice to be able to edit out or add waypoints to my list on
the computer, then stick them into the GPS just before season starts.

Word to the wise: If you're looking at used GPS's, don't buy
anything less than a 12-channel parallel receiver. I borrowed a
GPS-45 during hunting for a couple of years. That was one of the
reasons I bought a 12-channel parallel receiver for myself when I
could. The GPS-45 couldn't handle any sky blockage due to its design
(one receiver multiplexed between eight satellites).

We have had a premature winter here in NWVT. My yellow Etrex stays running
24/7 in my Ranger and my wife's Explorer and the D700's get shut off. Both
Etrex's have stayed running all this week at temps in the vicinity of +3F. I
found mine shutdown the morning after the night it went just under 0F.

My Garmin II+ seemed to be able to handle down to -15F ... But of course
that triangular prism shape had less surface area for per volume for a
somewhat higher power consumption ... That is, it put more heat into a space
with less surface area so it probably stayed warmer longer!

  cheers ... n1bq

Here is an IDEA I just had today. Sinec the tones for SSTV go between 1200 and 2300HZ and AX.25 packet is 1200 and 2200 Hz, then it is possible that a short AX.25 packet can be sent within a line of SSTV!

If the shortest packet is something like WB4APR>MYBOAT:

Then we can send the SENDERS call and a 6 character IMAGE name in only about 18 characters of AX.25 (or so). The original SSTV was 15 lines per second or about 70 ms per line. SHucks, it takes about 125 ms to send that shortest packet. Nevermind. But close...

But imagine if we could, then a TNC monitoring SSTV would show who is sending what...

I have a question about position timestamps.

Is there a way to recover the time heard from findu (i.e on the raw data list) ? If there is do any of the cgi's offer an option to plot the timestamp with the position. If its possible I have not been able to figure it out.

Just trying to understand position time parameters and would like to understand if its possible to see the time of each posit, either in raw or line plot form.

TIA
Peter

Hello all...
I have recently changed from hosting my own webpages to a commercial hosting company. I have done away with having a subdomain name for everything also...

With that, the URL for my findu query page (thanks N1BQ) has changed. The new URL is http://tourge.net/n2yqt/findu.php

I notice several site linking to this page so I figured sending one message here would be the easiest way of getting the info out.

Thanks!
Ryan

Apparently this already exists, see the chromapix dox, where they talk about "caller ID", apparently a way of tagging the image to a callsign.

If you have a callsign and a time, you can get the position from the APRS stream, we don't need to put it in the picture data.

I am running Pocket APRS with a Kenwood THD-7 and have noticed some station reporting on my screen from a 1000+ miles away. I looked at their path and find they are using "TCPIP" and then the call sign of our local digi. Does this mean they are going over the internet and then being repeated by our local digi? If eveyone did this would this cause a problem? Common sense appears as it would cause issues.
This brings me to question what the acceptable paths are. Does anyone have a standard list of paths besides what is in the cryptic Kenwood manual that are acceptable and a small note with the purpose of each path?

I'm looking at a local RF station and his path is via APS214/V. I know by this, he is running APRS+ v2.14.

If this is all I get in his path, is this a direct RF packet? I ask this because my home station, the one I'm receiving the station in question on, is about 5' off the ground inside the house. This is only to monitor local RF. His PHG statement is 2090. I know this is a 4W, 10', 9dB gain, omni antenna station. His distance is 46.7 miles.

This is not a unique phenomenon - I see this station all the time on my home setup.

Tnx es 73,

Joel Black, W4JBB

Yes! This is a great little feature.

>If eveyone did this would this cause a problem?

This is a trick question because I would hope that most Igates are setup to gate local messages. However It would kill APRS if every Igate sent every message on the internet to RF. As of a matter of fact even 1/6 of the traffic on the internet would kill APRS.

>   Common sense appears as it would cause issues.

hehe With Common sense it work great! This subject can be debated for years However most Igates do restrict traffic to a digree from the Internet to RF. My Igate is set to gate does not gate any packets but local from Internet to RF However if someone local goes out of town I will set it so that all of there beacon packets are gated. With a restriction of only gating 6 packets in a 1 min period 9 packets in a 2 min and 12 in 3 min.
This help to make sure I do not flood the local network.

> This brings me to question what the acceptable paths are. Does anyone have
> a standard list of paths besides what is in the cryptic Kenwood manual that
> are acceptable and a small note with the purpose of each path?

Let me encurage you to go by the rule of using the minum power to make the contact.
By this I mean set you proto path to get you to the nearest Igate or to cover an area that you wish to be heard in. Most of the time 3 hops will do the job. I made a 900 mile contact in 4 hops. This does no hold true for everywhere so but does should the possibility. The most important thing is to keep in mind what digies are local to you. If you have a wide area digi then there is no reason to use Relay in your path. Also try to look at the other stations path to determine a return path. If they need to go threw a relay only digi then you will need to make sure that you use the same digi as your last hop.

Most of the best paths will be set so that you can see the first digi used and the last digi used.
So ARPS, RELAY, WIDE3-3 will take you 4 hops. The APRS is just the "to call" and does not count as a hop. RELAY can be changed to WIDE if that is the first digi you will be using.
WIDE3-3 will take your packet 3 more hops. This path is probibly the most used. However some WIDE area digies will not pass traffic as a RELAY. TRACE is used most in the US to help determine a direct path to a station.

If everyone used a path such as APRS, RELAY, TRACE5-5 it would increase the

```
load on
the aprs network to the point of killing it.  However there is useful
information that many folk
like to gather buy using TRACE so some folks will encourage its use.   I
feel it is best to use
TRACE only when establishing cantact with another station.  Once you make
make contact
then that station can see a direct return Path for the QSO.  When you
recieve his packet you
will be able to use the reverse of it to continue the QSO.  Now you are
using the least amount
of "POWER".

I think the best method in setting up your path is to monitor the local
network for awhile.  Then
take note of the nearest Igate and the area you wish to cover with your
beacon.  So long as the
Igate is within that area you are set.  If not you might wish to increase
the hopes to get to the
Igate.  Remember this system was created to be flexable.  So common sense is
really the key.
So as long as you enjoy what your doing and it does not prohibit other from
enjoying APRS too.
You can use any of the features APRS has to offer. 8-)

```
Correct me if I am wrong here but I am in Cheyenne and link in to the denver
server or aprs some 200 miles away, the server then sends out my packet via
their server and that is how your station is showing up.

Hi Alex,

It may seem unwise but I have put some self-adhesive film on top of my car
roof.
The diameter is larger then that of my magmount, this assures I do not hit
the paint of my car by accident.
Another plus is that I do not mind having an unknown magmount on my roof :
it's well protected!

See http://www.hornschuch.de/html/english/dcfix/glass/index.html for
details

Rendered body type: text/plain

```
Group,
With all these new thoughts on APRN and SSTV I am very interested and can
not wait to play more.  I have some really good ideas now to make this work
really well, but from everything I can tell it has to be done on a seperate
frequency from APRS, which is what I figured.

So, my question is, what is the UHF frequency, if there is one, that has
been dedicated to this form of SSTV?  Also, I read something about an SSTV
repeater.  Do these exist on UHF in some states?  I really want to find one
frequency and stay on that so I can have multiple SSTV receivers around my
state using APRN and have the same if travelling to other states that use
this concept.
```

Is UHF the place to do it? If not, what else may be? Any HF?

Thanks everyone,
Mike Wolthuis

Servicios:
Masaje Antiestr�s Ejecutivo
Se realiza por todo el cuerpo. Es un tratamiento suave que se realiza con el paciente desnudo o en ropa interior c�moda y que ayuda a descargar todas las tensiones acumuladas. Es un masaje que se puede realizar en cualquier momento y que resulta muy agradable para quien lo recibe.
Precio Normal $ 375.00
Promoci�n $ 250.00

Masaje Reductivo
Es un masaje reductivo donde se trabajan las zonas con mayor cantidad de grasa, produciendo calor con movimientos especiales que ayudan a disolver las grasas.
Precio Normal $ 2,200.00
Promoci�n $ 1,500.00
Consta de seis sesiones

Masaje Anticelulitis
Se trata de un tipo de masaje totalmente atraum�tico, particularmente indicado en el tratamiento de la celulitis, donde ofrece excelente resultados. Su finalidad b�sica es ayudar en el retorno de la linfa, facilitando de esta forma los efectos y funciones del sistema linf�tico.
Precio Normal $ 3,800.00
Promoci�n $ 2,500.00
Consta de diez sesiones y se recomienda tomarlas en un m�ximo de 25 d�as.

Masaje a cuatro manos
Los masajes a cuatro manos le hacen sentirse a uno estupendamente, suponen un b�lsamo para la piel y aportan un relax total.
Precio Normal $ 750.00
Promoci�n $ 500.00

Masaje para parejas.
El cual tomaras en un cub�culo doble en donde t� y tu pareja disfrutaran de un magnifico masaje relax sin perderse de vista el uno del otro, comparte con esa persona especial este momento inolvidable.
Precio Normal $ 750.00
Promoci�n $ 500.00

Estamos a tus �rdenes de Lunes a S�bado de 10 a 21 horas.

Try making the window full screen then move the scroll bar down to the bottom. I think it should start scrolling.

Rendered body type: text/plain

The very nice freeware program MMSSTV has many options that I've never heard of before. One is FSKID. If you enable FSKID, the program will encode your callsign in FSK at the end of the picture. The receiving end takes the callsign data and fills in the ID field on the user's screen.

I don't know what the FSK parameters are, but it seems to me that the foundation is in place for an APRS-formatted FSK packet to be appended to the end of the SSTV picture...or, heck, even a standard 1200 baud AX.25 APRN stamp. Someone would have to convince the MMSSTV software author to incorporate it.

Group,
With all these new thoughts on APRN and SSTV I am very interested and can not wait to play more. I have some really good ideas now to make this work really well, but from everything I can tell it has to be done on a seperate frequency from APRS, which is what I figured.

So, my question is, what is the UHF frequency, if there is one, that has been dedicated to this form of SSTV? Also, I read something about an SSTV repeater. Do these exist on UHF in some states? I really want to find one frequency and stay on that so I can have multiple SSTV receivers around my state using APRN and have the same if travelling to other states that use this concept.

Is UHF the place to do it? If not, what else may be? Any HF?

Thanks everyone,
Mike Wolthuis

2 meters has lots and lots of unused spectrum. We have 100 repeaters in the baltimre washington DC area on the books, but scanning the band during monrning rush hour and you might hear 4 of them in use....

Bob,
The problem with using two meters from what I have been told is that if
I run Band A on APRS (144.390) and use Band B for SSTV (VC-H1) on a
2meter freq. then the two will not coincide very well because they have
to wait for each other to transmit and then when SSTV is TX no APRS data
is available on RX either. This was info from one fellow ham that I
got, the VC-h1 is not here in my hands yet so I can not really attempt
anything, plus I have to build a receiver station yet.

I was told if I run it on UHF on Band B that they can coincide with each
other. Then I can pull my APRS position off of the national feed to
overlay with the picture received on the SSTV freq.

One other thing confuses me, when you talk about repeaters, can SSTV go
through a standard voice repeater? I didn't think so, but maybe I am
wrong. If so, why not build a HIGH UHF machine for SSTV?

Just still trying to figure everything out. Everyone's input surely
helps!

SSTV will go through a voice repeater just fine. There's nothing in it
outside the voice bandpass. Some repeater groups/trustees might take issue
with SSTV on their repeater (which is certainly their right to do) but
that's a political issue, not a technical one.

Hi Michael
                 Yes SSTV works through regular voice repeaters.
There is just two things you have to do first. Number one is the most
important.
```

1) Get repeaters owners permission first.
2) Key the pit switch on the side of the vh-c1 first. What you want to do is
bring up the repeater before you transmit your picture. You would normally
key the vh-c1 pit button announce your callsign then
release the pit button then immediately push the vh-c1 picture transmit
button.

Most repeates have a delay when they are first keyed. You have heard the
effect when the first characters of a Hams transmission are clipped because
they started talking before the repeater has completely come up. By doing
what I have suggested you will not lose the first bytes of your SSTV
transmission.

More often then not, it is the fact that you are using CTCSS, and your radio
is slow to unsquelch. I have a scanner on a local linked repeater system. I

always hear everything said on the scanner, but there is a full second if not
two delay on the TH-D7 before the squelch opens on it...

You QSY the A side (APRS) to the SSTV uplink frequency for the 40 seconds
it takes to do an SSTV uplink. The other 99.99% of the time it stays on
144.39. The only time you need to uplink an SSTV picture is when you see
a fire, a Wreck, a Terrorist of whatever...

Remember, your ARPS packet on the SSTV uplink frequency tells the APRSN
system who is sending the picture...

Rendered body type: text/plain

Even though SSTV tends to get lumped in with "digital modes" like packet,
RTTY, PSK31, etc (probably because it gets generated most of the time by
sound card-based software), it is definitely NOT a digital transmission
format. It is totally analog, a vestige of it's origin over 35 years ago,
before any hams had computers.
     SSTV is based on frequency-modulated AUDIO tones, borrrowed from early
fax and HF "radio photo" transmission schemes, in the range from 1200 to
2300 Hz   You stuff these tones into any radio's mic jack to transmit. On
receive, you recover these same audio tones from the radio's speaker
terminals or equivalent. SSTV is normally transmitted on SSB on HF and FM on
VHF/UHF.   The (single) tone frequency is CONTINOUSLY variable based on the
brightness of the points on each scan line with 1500 Hz being BLACK and 2300
Hz being black. Periodically a brief burst of 1200 Hz indicates the beginning
of a new line (i.e. sync).
     Over the years, various additions have been tacked onto the SSTV
protocol to include color, and data in audio FSK format (the VIS burble at
the beginning of each frame that identifies which of 20-odd transmission
formats an SSTV pic is being sent in and mmSSTV's FSK callsign ID at the
end).   but basically SSTV remains analog.

It is literally analog NTSC in slow motion -- while NTSC sends 30 complete
approx 500-line pictures per second, the original SSTV format sent 1/8th of a
128-line B&W picture per second; i.e. a 128-line B&W pic in 8 seconds. By
slowing the HORIZONTAL line rate down from 15,000-odd per second to 15 per
second, the bandwidth drops from 4-to-6 MHz for standard TV to 2KHz or so,
allowing SSTV to be transmitted through any narrow-band voice grade channel.
     The 8-second transmission period was determined by the limitations of

the receive display device of the day - a long-persistance radar-type CRT -- remember no memory devices at the time! The incoming image was painted from top to bottom over 8 seconds, meaning the top of the image would fade away just about the time the bottom was finished. When computer-type memory started becoming practical and affordable in the late '70s, the image could be accumulated and stored over a longer interval, and then played out 30 times a sec into a standard non-fading monitor or TV. This lead to the modern era of much-longer-transmission-time higher-res color SSTV formats, most of which are 1/4-VGA (320 pixels by 240 lines). Currently a (very) few users are experimenting with std VGA (640x480) and SVGA (800x600) formats that take up to 3-5 minutes a frame to send.

In a message dated 12/8/2002 5:29:46 PM Pacific Standard Time, wj9h@ARRL.NET writes:

> The very nice freeware program MMSSTV

Get it at:
   http://www.qsl.net/mmhamsoft/mmsstv/   -- WA8LMF

>
> I don't know what the FSK parameters are, but it seems to me that the foundation is in place for an APRS-formatted FSK packet to be appended to the end of the SSTV picture...or, heck, even a standard 1200 baud AX.25 APRN stamp. Someone would have to convince the MMSSTV software author to incorporate it.

This assumes you are using a sound card computer to send and receive SSTV. The assumptions in this thread have been that SSTV transmissions in the field are being ORIGINATED by the Kenwood VC-H1 dedicated hardware device, not a computer. The buggy and effectively unchangable VC-H1 firmware severely limits what might or could be done. In a way, this is very similar to all the APRS kludges and workarounds driven by the limitations of the D700 and HTD7... [I have all three devices by the way.].

In a message dated 12/8/2002 12:17:35 PM Pacific Standard Time, wolthui3@msu.edu writes:

> So, my question is, what is the UHF frequency, if there is one, that has been dedicated to this form of SSTV?

There is no nationally (or internationally) recognized standard frequency for SSTV on any of the VHF / UHF bands. For decades, the international HF SSTV calling freqs have been:
  3.845
  7.171
  14.230 with overflow from this constantly busy freq on 14.233
  21.340
  28.680
For some reason, no SSTV freqs were ever standardized on the WARC bands. As a mobile SSTV op, I have often wished for a standardized SSTV calling freq on 2M but there isn't one.

>
> Is UHF the place to do it? If not, what else may be? Any HF?

You are probably thinking of FSTV (standard broadcast-style NTSC fast scan). There are FSTV repeaters. They normally operate at the low end of the UHF band (420-438) with some having inputs on 1200 Mhz and output on 420 or vice versa. Because of the enormous bandwith of FSTV (greater than 4.5 MHz for a single signal) it is neither practical nor legal in the lower bands. Because FSTV is essentially modified AM with one sideband partially suppressed, you will need a specialized transmitter -- your D700 (or other FM transceiver) will be useless for this purpose.

The freeware mmSSTV program DOES include an --SSTV-- repeater function. Like any SSTV program, mmSSTV stores the incoming image as a .JPG or .BMP file on the PC. The program can be configured to then key up the transmitter and re-transmit the same image. Note that this is a store-and-forward function much like a packet digipeater that can be done on a simplex channel with any ordinary radio. The program looks for a 1750 Hz access tone for a second or so before it will "repeat" an image. Again a problem with the hardware-based VC-H1! A few stations attempt to run the mmSSTV repeater on 20 meters but remember SSTV IS ANALOG!! This means the re-transmitted pics almost always include noise and QRM experienced when the repeating station received then. The repeater mode works much better on 10 meters when the band is open since there is usually far less noise and QRM on the band. If you can hear SSTV signals at all on 10m they will almost always be clean and noise free.

In a message dated 12/8/2002 7:32:18 PM Pacific Standard Time, bruninga@usna.edu writes:

> You QSY the A side (APRS) to the SSTV uplink frequency for the 40 seconds

Only for the very inferior Robot 36 transmission mode! Any of the better-quality SSTV modes will require upwards of a minute or a minute and a half to send one frame. R36 is fine for sending CQ slides. Indeed I wish more people would use R36 on HF for CQing instead of tying up the channel for a full minute and half to simply display "CQ DE W9XYZ Joe in Chicago" type text in Scottie 2 format (typically in an illegibly-small font!). However, if you want to show detailed pics, usable maps, schematics, etc you simply HAVE to use a better quality, longer-transmission time mode. Again, the usage of R36 is primarily driven by the limitations of the VC-H1 and it's inability to originate a transmission in any mode other than R36 unless it is being controlled by an external computer.

BTW, the VC-H1 and the Robot 36 mode seem to be overwhelmingly a VHF thing -- probably due to it's more-or-less plug-n-play capability with the TH-D7 handheld. Approximately 80% of the SSTV stations that I have worked on HF (where the vast majority of SSTV activity is) are totally unaware of the existence of the VC-H1, let alone it's crippling firmware limitations! I can't count the number of times I have had to describe the device (and send a canned pic of me holding it) to stations I have worked on HF. Most (and essentially 100% of the newcomer SSTV'ers recruited to the fold by the freeware mmSSTV program) assume ALL SSTV emanates from computer-sound-card-based apps.

The Frontgate catalog shows a complete (Thermo/Hygrometer/Wind/Rain
Gauge)wireless WX station for only $249 and made by La Crosse Technology.
Anyone have any experience with this unit and interfacing it to APRS?

Yes, a standard voice repeater can handle SSTV, I've done it several times in the DC area, only problem being the stuck key timer not being quite long enough to pass the last few scan lines.
"Michael J. Wolthuis" <wolthui3@msu.edu> wrote:One other thing confuses me, when you talk about repeaters, can SSTV go

Wow! That's one tight timer. We use three minutes here.
I've also done it over the repeater, when I was out of simplex range, and I was sending damage reports from a hailstorm.

It does irritate some people.

If the repeater audio bandpass is narrow or sloped, it will cause problems with the picture, but on most repeaters this won't be a problem.

201. [aprssig] geocoding?

From: wes@johnston.net
Date: Mon, 09 Dec 2002 11:06:24 -0800 (PST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-110251-2002.12.09-13.51.27--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Does anyone know of an engine on the net which will take a longitude and
latitude and convert to a street address? Eagle geocoding takes a street
address and converts to lat/long, but I need the other way around. The
application is my homeseer script which could very easily evolve into "aprs for
the blind". As of now, I have a script which pulls posit data from
aprsworld.com and gives a location as 1.1 miles Southeast of WAYPOINT (walmart,
mall, home, etc). It would be slick if I could easily map these locations to a
street name as well. Since home seer is able to make web queries, this should
be a simple task.

thanks
Wes

203. [aprssig] TH-D7 Voice modulation strength

From: Henk de Groot <henk.de.groot@hetnet.nl>
Date: Mon, 09 Dec 2002 21:26:29 +0100
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-110261-2002.12.09-15.12.16--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hallo,

A short question. I mostly use the TH-D7 for APRS but in sometimes I also make voice QSO's. I got a report the other day that the deviation on the voice was low. I was using the internal mike and not the external SMC-34 which I normally use for this.

Now I wonder, do others experience the same thing? With the external mike the voice is much louder and better according to the reports.

I wonder if mine is broken, do others experience the same thing? Anybody having a service manual? Can the modulation when using the intenal mike be increased without affecting the external mike volume or TNC modulation? If yes, where can I locate the trimmer that is used for that. Modulation of the TNC is okay (that's the most important) but low voice is annoying since I don't want to take the external mike with me when I travel light.

By the way, is it realy a mike inside the TH-D7 or is the speaker used as mike instead? I took a look at the inside and could not find any electret microphone anywhere.

I hope somebody can help me.

Kind regards,

Henk.

I'm not familiar with this radio, but a few things to consider.

Packet normally uses a max deviation of 3 kHz and voice 5 kHz. If the transmitter is set for packet, then naturally you would not have as much deviation as you would expect from a voice radio.

An easy check is to take a service monitor and set it for the transmitter frequency. Holler "FFFIIIVVVEEE" into the microphone. Observe the max deviation indicated on the scope and y'all will know. It should not exceed 5 kHz, usually around 4.8 kHz.

Checking the service manual for the TH7A/E, there is definitely an internal mic that is routed through a closed-circuit contact on the ext mic mini jack; i.e. no separate level adjustments for the internal mic.

Checking my own TH-D7A(G) on 2M using my IFR-1500 comm monitor, I am getting about 4KHz peak deviation [dev limiter seems to clip at that point], both from the internal mic and from an ancient Kenwood SMC30 speaker/mic from a long-deceased TR-2600 handheld.
The IFR has switching to read either peak or average deviation on it's internal meter. The average mode is showing about 1.5-2 KHz on the internal mic and about 3 on the external one when talking into it in a quiet indoor setting. I'm sure that when I close-talk the mic much more loudly outdoors, or in the car, the average level will come much closer to the peak value.

There ARE separate deviation trim pots for "UHF Dev" (VR1), "VHF Dev Wide - US" (VR2) and "VHF Dev Narrow - Euro" (VR3) on the main board. If you need a scanned image of the Adjustment Points Diagram, let me know and I'll email one direct.

Except that the internal audio paths in the D7 and D700 for the built-in TNC
and the mic are completely separate. There is no fixed relationship between
the mic level and the TNC level.

One can only ask.

>"This is a voice repeater. I don't want that noise on my repeater." or "How can the control ops monitor the transmissions to insure no improper or illegal pictures are transmitted?"

Presumably by running SSTV software? :)

Sure, but first you've got to convince them to get it and run it. Not everyone wants to go thru that trouble.

One could do what I did 3 years ago. Put up a FM repeater dedicated to SSTV
use.
Very active every evening from 8 PM CST to 10 PM.
Have 8 to 20 in roundtable every night. Some have become quite good at
photography.

Hi Folks,

What would be the best path for mobile operation to hit the ISS, PCSAT and just normal APRS operation without having to change the path in my TH-D7 which is a pain while driving!

Thanks,
KB1EAA, Dave

214. [aprssig] 16 bit (and larger) Telemetry

From: Steve Dimse <k4hg@tapr.org>
Date: Tue, 10 Dec 2002 03:06:14 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-110321-2002.12.10-02.51.27--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'm involved in an APRS project that requires telemetry with greater precision than the 8 bits provided for in the APRS spec. This data will be transmitted using the "user defined" part of the spec. Rather than develop a format specific to this application, I am going to make it as general as I can, so that the findU tools I am writing to manipulate the data can be used by other applications (thereby hopefully avoiding some requests for special user-defined formats).

I'm bringing this up here because I'm open to suggestions, at least up until the first remote device is deployed. If you have ideas that would make this more uesful, please share them.

The basic plan is for two different packets, one with positive hex integers, the other with base 10 numbers (which may be signed or unsigned, integer or floating point).

The reason for two formats is that hex is easier for embedded devices to encode than decimal, and can also save a few bytes on ech packet, depending on the number and size of the values. However, it is hard to do negatives in hex(when there is not a set bit-length of the number...is FF a 16 bit 255 or an 8 bit -1?) and damn near impossible to do efficient, cross-platform floating point.

There is no official limit on the number of values in the packet (there are practical issues, but the format, and my code do not set the limits), fields are comma delimited, datapoints without values are represented by a true empty field (two consecutive commas or comma at the end of a line). I propose using the character T (telemetry) for the user character, and H and D (hex and decimal) for the format character.

Note there is no timestamp or sequence number in this spec. An individual user is free to designate one of the fields for that function, but there is no wasted space for those who don't need it.

Examples:

```
}TH243,AE,4F2,,12,0,FF
```

```
}TD134.2,42,0,-23.3,0,

Again, this is under the user-defined part of the spec, so it is not a matter
for the APRS WG (other than allocated the specific format characters). If you
have a need not met by whatever we end up using, you can create at different
format to meet your needs. As I say, I'm bringing this up now because I would
like to have the spec and tools as general purpose as possible.

As a teaser, I'll show an example of a prototype of a new telemetry cgi. This
uses the Ploticus plotting package (http://ploticus.sourceforge.net)...a very
powerful program with its own complex scripting language, but this prototype
uses one of their "prefab" scripts, chron, which plots time on the x axis. It is
limited to plotting a single line, obviously not good enough, I'll have to learn
the scripting language, but this hints at what can be done:

http://www.findu.com/cgi-bin/tele1.cgi?call=k9d9&last=72&param=1
http://www.findu.com/cgi-bin/tele1.cgi?call=kj7az-6&last=72&param=2

(param is which of the tele values to plot, in addition 0 is the transmitted
sequence number, while -1 is the received sequence number).

The final tele cgi will work on the original 8 bit format and either of the new
ones automatically (i.e. it will sense the datatype and do conversions
automatically, no need to specify the format).

Comments encouraged! (and can someone post this on the aprsspec group, I'm not
subscribed!)

Steve K4HG

I'd suggest adding a comma after the }TH, and }TD, to separate the first data field from the header... Or maybe a colon, but I think the comma is simpler... Then you dont have to use up a special character when importing it into Excel.

I think it is superfluous...the user defined format insists that the first three characters of the payload are used to identify the type, there is no need to insert another character there, you can remove the packet format characters and extract the real payload either by search and replace or by substring. Granted, it would be more human readable, maybe avoid an embarassing question about this packet:

K4HG>APRS:}THE8,BA11

So Steve, why are you behind the eight ball????

Other than that entertaining scenario, I don't see any advantage...

How do you intend to interface it?  It doesn't appear to have a computer
interface.   I can't even find a comparable model on the La Crosse web page.

In addition to adding a comma after the }TH, and }TD,  (as shown)...
I think I agree with Steve's philosphy of minimal additional constraints,
but any person sending such telemetry, would, I hope, send a
sub-idedntifier as his first data field, so that if he has multiple such
applications under his callsign, that the first field can then be used to
idenfity WHICH of his applications is sending the data.

As is, the only way to identify this "application" is by the originators
callsign and possibly his ALT-NET (AX.25 To call).  This is OK, but FINDU
does not currently store the ALT-NET field.  I would like the
"specification" of this format to include the encouragement for users with
multiple different applications on the air, to use their first data field
as a sub identifier.

The more I think about it the more I like the idea of requiring the first
field to be an identifier.  The reason is that everyone usually starts
with one application and may not have any intention of later adding
another application under his call.  But if he was not smart enough to
anticipate future applications and did not put one in his first such
application, then when he puts his second one on line, he now has a
problem in parsing... and data base compatibility...

By making an identifier field as part of the specification for this
format, then we are helping them from making this mistake...  The
identifier field can be null ",," and the cost then is only one byte of
overhead even if the person doesn,t want to specify one initially...
But at least his first application has a "null" identifier that can keep
it separate from any later applications...

To make it easy to recognize when PCsat has done a reset due to low
batteries in the dark, we are loading it with the callsign of PCSAT-1.
She should still respond to the W3ADO-1 digi callsign.  If she resets,
then the callsign changes to W3ADO-1 in every packet and we know to
restore her on the next pass.

I would welcome all users to enjoy PCsat.  But it would be best if no one
used PCsat after dark and before Sunrise to give her a better chance to
make it to sun a few minutes later...

221. [aprssig] APRS Tracker legalities

From: "Phil Pacier, AD6NH" <ad6nh@arrl.net>
Date: Tue, 10 Dec 2002 11:31:19
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>

I wanted to throw this out and see what you guys think. I'm in charge of a small task force looking into the feasibility and legalities of installing APRS trackers in more Baker to Vegas relay race chase vehicles. The question we're trying to tackle is whether or not it is legal to have a simple tracker (a device that only transmits a position beacon on 144.39 and has no other transmission mode or frequency capability) in the vehicle with no licensed ham present. My own thought was that trackers might fall into the same category as digis and repeaters - there needs to be a control operator who is responsible for the transmission, but does not necessarily need to be "on site." For example, if a monitoring station noticed a tracker transmitting erroneous data or harmful interference, a person in the vehicle could be contacted to "pull the plug". Is this too much of a stretch?

The APRS community has been very accommodating when it comes to the Baker to Vegas race, allowing tactical callsigns to be used in tracking vehicles. Our goal is to get trackers in a majority of the vehicles so that team members and viewers at home can watch the "virtual race". It also serves its purpose in emergency situations, obviously.

Any comments you may have about this would be welcomed. Thanks for your time. Continue to check the Baker to Vegas java tracking page at http://www.aprsca.net/bakervegas.asp - soon there will be more detailed maps and a new interface for tracking. Enjoy! 73s.

I've seen plenty of discussions about just this sort of thing. I'm in the "don't ask for an FCC ruling on the matter" crowd.

My opinion (and it's just that, an opinion), is that this sort of operation is mostly ok, but just to be on the safe side, the unit should be enclosed completely, equipped with an on/off keyswitch that only hams have access to. If you could have over-the-air control of the unit (I would think impractical in this case), that would be best, but just having a control operator somewhere in the vicinity of the race that could eventually command the station off should keep you within the rules.

The tricky part is that you don't want a non-ham able to turn the unit on, as they are then acting as the control operator of an amateur radio station, without a license.

Nit-picky, I know, but that's what I think will keep you within the rules. I expect you'll hear nit-pickier (good word huh?) views than this on the matter.

Good luck and I wish you well. I think this is a wonderful use of APRS. If I was in that area I'd be helping.

Another possibility might be to use KPC-3 TNC's in there, and use the control bits to be able to send a message across the air to it and have it flip a relay that shuts the transmitter down (killing PTT perhaps?). This might not protect you in all cases of bad transmissions, but would go a long way toward giving you some control. If you just hooked the relay to PTT, and left the receiver running, you could command the units on/off the air at will. Of course KPC-3's are a lot more expensive than TinyTrak-II's and similar.

No comment other then I wouldn't go out of your way not to break the APRS
spec (you said something about being in the user defined field, implying that
you had to carry some payload you don't need). If you review the requests to
the APRSSPEC over the years, you'll see a telemetry format was tops among
them.

Normally wouldn't suggest this to anyone, but your in a position to drive the
spec/avoid the kludge and since you have a personal need, might as well kill
two birds with one stone.

However you chose to do it, good luck. I'm sure it will be useful.

Jeff

Lacrosse weather stations are in the Ramsey catalog as well.  I
think I remember seeing that at least one of them had a computer
interface option.  Don't have that catalog with me.

```
For all the discussion of SSTV through Repeaters, see my examples from a few
years ago at public service events in the Boston area we did through
repeaters, and through mobile crossband repeaters to repeaters.

 Examples on the web are at:

http://www.qsl.net/n1cpe/
http://www.qsl.net/n1cpe/baa.html
http://www.qsl.net/n1cpe/w4h.html

 These use VC-H1 and TH-D7 on the transmitting end.

```
Hi All,
I have just purchased a Compaq 3850 and installed the latest version of
APRSCE. (It is also registered).
I have connected it to my dm700 and thd7 and in both cases I cannot get it
to read GPS information.
The GPS strings are showing in the little monitor window but the position is
not being recognised.
I see the TNC commands going out and responses coming back so the
connections are correct.  Positions of other stations are being received
when I select fixed position my position is transmitted.
Can anybody help?
Thanks
Ron Smith

The newest LaCrosse Weather Station, the WS2310, has a computer interface available. The interface is some type of an RS-232 connection. I assume it's a DB-9. It comes with software to display the different readings on your computer, but it's also compatible with the popular Weather-Display (www.weather-display.com) program. You can see all the specs on the WS2310 at http://www.gear101.com/lacrossewallhanging.htm. Scroll down and it's about 1/3 of the way down. One note on this weather station though. The wireless transmitters are NOT solar powered, which is a BIG drawback at remote installments. That is the only reason why I don't own one right now.

Things to check
1) go into setup - communication - GPS and make sure the GPS enable box is checked
2)In the same window make sure the option "get GPS data from TNC(automatic)" is selected
3)go into setup - Station - Pos and make sure the option "Use Moble Position Reporting Rate of every N minutes" is selected.
4) make sure the Transmit Position Reports check box is checked. Its in the same window.
I think you overlooked one of these. Good luck

Hi all,

It appears to me in looking at the pix on the web site that there is a single remote transmitter (actual RF transmitter), or at least, with a single source of power - the two AA batteries specified.
I'd say it's likely that the minimal solar capability needed could be added to this system.
It might even work with something as minimal as a small solar NiCd battery recharging station connected across the battery terminals inside the transmitter.
Do whatever weatherproofing the recharging station needs, and add two AA NiCd's and you're done.
The recharging station should already have both the anti-discharge blocking diode, and a means of limiting the voltage applied to the cells, to prevent overcharging.

Rendered body type: text/plain

Does anyone have experience with the Alinco DR-135TPG.

I am interested in experiences good and bad. My application is as a mobile tracker AND Digipeater. I am curious if it will digipeat and respond to relay. My use is to support my D7 when hiking and to act as a tracker when mobile.

TIA,

Peter

I had really good luck with it as both a standalone tracker, tracker with UI-VIEW32 and a base with UI-VIEW32 and winaprs.

This units will not digi as is but could in KISS mode with and aprs program like UI-VIEW or WinAPRS. Not sure how stable the unit is in KISS mode.

>them.
>
>Normally wouldn't suggest this to anyone, but your in a position to drive the
>spec/avoid the kludge and since you have a personal need, might as well kill
>two birds with one stone.
>

First, I'm not in a position to drive the spec. I'm not a member of the APRS WG, You, as another prominent member of the APRS community, have exactly as much ability to drive something with the APRS spec as I do, which is almost nil. This was exactly why we included the user-defined format into the spec, so that good applciations did not need to wait for the APRS WG to approve something. Should this, or any other user defined format become generally accepted, the APRS WG is free to add it to the official spec at any time.

Secondly, this is not a kludge. Even if I were to have some magical power of the APRS WG, this is still what I think is the best way. There are very few symbols yet to be assigned, this is not an application I think deserving enough of one of these. The extra overhead is 2 bytes/packet, hardly a major concern for a low volume application!

```
I would suggest using a KPC3+ ver 8.3.  With it you and a 2 meter rig you
can do anything.  Well almost anything. hehe  You can set it up as a tracker
or a digi with its own gps support.  It can do telemetry so it is possible
to keep an eye on battery power.  It uses little power and Radio shack has
the 252 going for $99 so the price would be close to that of a dr-135.

```
I have found it impossible to match the 252 with the KPC, I have not been
successful with the 2 at all.
We have dug around on the net looking for information and it is extremely
limited.
I have found a schematic describing wiring it to the detector, but I think
that would be allot more trouble then it is worth.

I do recommend the Yaesu FT-2600, KPC3+ and the Garmin Etrax. This is the
```

setup I have in the car {kd7kyo-2} and the setup is like a hand in a glove.

I have now wired the 252 to my MFJ and it is working just fine at the home
qth.

If there is a definite setup for the 252 and the kpc please post it.

So how is one going to tell what the data is being transmitted refers to ?

Is it temperature, humidity, voltage, gallons per minute, or rosehits* ?

Or is everyone going to have to define their own user format for each type of telemetry ?

*What's a rosehit ? about .338

>From my memory of Part 97 and my knowledge of VK rules
UNATTENDED PACKET OPERATION IS LEGAL SUBJECT TO
        * Normal ID requirements
        * The ability for the equipment to be turned OFF if the need arises, by an UNLICENSED person
        * Controls being inaccessable (frequency) [Not sure if this is still a legal requirement]

Question:
        Is it permissable for you to have an unattended packet station at home if you leave the country for an overseas trip?
Answer:
        YES.

Well, what is the difference here. The only difference is that the device is mobile. That is not much of a difference.

> and then, Can anyone offer any suggestions?

Yea. Keep the power very clean to it, and above the minimum voltage. Mine sometimes loses all of its configs even then. I try to use it in a manner where it doesn't need to keep its configs, like hooked up to an APRS program that initializes it each time. Starting your car engine while it's plugged into the vehicle might cause it to lose its configs or lock up.

I sent mine in for an upgrade a while back, which was completed. I haven't used it a lot since I got it back, but I'm hoping it's better now for some of these cases. Mine was a very early production model. As soon as I find my bag of powerpole connectors, I'll set up cabling for my Jeep and start using it again.

Sounds good to me! I'm sure there've been cases where a spouse or other family member has been called while the ham was away, and told to shut off equipment. Pretty similar I'd say and seems to be in the spirt of "keeping it legal".

I'd _love_ it if it were allowed for a non-ham to both turn on and turn off an APRS tracker, as long as other controls such as power level, frequencies, tones, offsets, etc, were still inaccessible to the non-ham.

That would allow non-ham SAR members for instance to carry an enclosed APRS tracker into the woods (with only an on/off switch accessible to them). It'd also allow unattended trackers for public

service events such as being discussed, with a non-ham able to "aid"
in the control by performing remote on/off control under the watchful
eye/ear of the (remote) control operator.

The intent here is good: Public service w/APRS under rules that
don't directly specify this exact situation. So why haven't we seen
all the cries of "that ain't legal" like we usually do when this
topic is brought up? Are people mellowing out a little? ;-)

Rendered body type: text/plain

Several people emailed me asking for more callsigns with active telemetry, so I
wrote a cgi:

http://www.findu.com/cgi-bin/tele-list.cgi

This shows all stations with telemetry transmissions in the last 24 hours. Many
of these only have a couple of points (anyone know why some D700's apparently
send a tele packet on rare occasions?). Links are there to show the old tele
plot (all parameters, one pixel per report), and the new one plotting the
parameters individually with calibrated time axis.

Hi Chris
Thx for the reply, these sites I have already been too and the one jpg image
is wrong for the 252, one fact is that the connector on the 252 is an 8 pin,
this diagram is a RJ-45, also if you follow this on the 8 pin it does not
work, we have tried 50 different combinations and it still wont work right.

there has to be someone out there that has actually made the two units work
together, and if I can get a viable schematic I will post it on my site and
on this list.

OK, guess that is a good enough reason, consider the proposal amended to include
a comma between the }Tx and the first number:

}TH,243,AE,4F2,,12,0,FF

}TD,134.2,42,0,-23.3,0,

Sure would be a better world if everyone knew Perl though ;-)

Even with the same software and hardware, two stations could transmit different values, because the calibration coefficients could be different. So just as now with the T# telemetry, unless people use the on-the-air mechanism to provide the info, there is no way to find out the actual meaning of any specific dataset.

I plan to address this on findU in two ways. First, the calibration coefficients and labels will be able to be specified in the cgi call, allowing people to create links which show true units and labels.

At a later date, when findU has user account infrastructure complete, a user will be able to store these on the server, so anytime anyone asks for a telemetry cgi, the values set by the owner will be used to plot the graph.

Folks finally got wise and ask the FCC or the ARRL when they have a question like that rather than ask a bunch of arm chair lawyers on a mailing list and seeing the same discussion unfold over and over again?

Maybe people even got a copy of the FCC rule book and have started to read it. This book can be had for FREE when you renew your ARRL membership. Or perhaps people are finally starting to hear Riley Hollingsworth message about using common sense when questions like these arise.

I wouldn't ask the FCC anything. This is a government agency, if you want a ruling, high priced lawyers are needed. A quick ruling by someone who is unknowledgeable about the issue, may have far reaching effects for all of ham radio.

It is your license at risk. Read the rule book, also remember rules are not everything. For instance, it is legal at the start of a QSO to not ID for ten minutes, but not very friendly.

Steve - that makes the telemetry coefficients only available on findu.com. That means that my site aprsworld.net can't plot their telemetry unless they re-enter their coefficients, but more importantly it means that normal APRS clients (Xastir,Winaprs,Macaprs,APRS+SA,dosAPRS),can't view the "new-style" telemetry.

I would definitely devise a means for sending coefficients over the air. With the cheapness of 10-bit and up ADCs there is going to be more and more uses for the telemetry format you put together .... might as well go the rest of the way and make it possible for the coefficients to be sent over the air to everyone. (Or from findu.com out to the internet and gated at the local igate's choice).

>I would definitely devise a means for sending coefficients over the air. With

There already is one (see the telemetry section of the APRS spec), and though
you cut out that section of my message, I specifically mentioned it:

>>So just as now with the T# telemetry, unless people use the
>>on-the-air mechanism to provide the info, there is no way to find
>>out the actual meaning of any specific dataset.

Perhaps I wasn't explicit enough, the new format is in no way incompatible with
the over-the-air format that supports the present T# format, though only the
first 5 values could be defined in this manner. I've mentioned before that findU
does not support this over-the-air definition at present, because despite
requests for any users to come forward, and despite searching through 3 years of
archived data, I've found no instance of even one of these packets appearing on
APRS IS. Furthermore, AFAIK, only Bob's client supports this technique at all.

My own opinion...I think there is a reason for this. People that send telemetry
do so for their own reasons, there is not an overwhelming need or desire to let
the world understand this info. Personally, I find some of the paramters being
telemetered very intriquing. I've noted long term trends that make me certain at
least one person is sending solar illumination data, or something else closely
tied with the solar season. I'd love to know the details. I begged, when I first
mentioned the tele.cgi, for someone using the tele format to share what was
being sent, but I never got a single response.

And at least under US rules, it is fully their right to keep the nature of the
values of the data they are sending to themselves:

97.217: Telemetry transmitted by an amateur station on or within 50 km of the
Earth's surface is not considered to be codes or ciphers intended to obscure the
meaning of communications.

People don't have to share the meaning, and the fact that no one implements the
well-documented method of sharing the meaning, one that has been in APRS as long
as I have (and we are talking double digits here), speaks volumes...

So, my emphasis in findU is to provide a mechanism for people to use the
telemetry for whatever their purpose may be, and to share the meaning, or not,
as they choose. And should someone chose to start using the on-the-air feature,
I'd support it in findU sooner or later (depending on how much they intriqued me
with the utility!).

Hi Steve and aprsssig,

> you cut out that section of my message, I specifically mentioned it:

Whoops, my bad.

It would be nice to be able to define the telemetry for more then the five
fields. Since it seems like we agree on everything regarding telemetry, let's
come up with a flexible way to define telemetry coefficients over the air for
more then five values.

One possible solution would be to send the coefficient and the label for each
chanel as a seperate packet. How about using the user-defined TC designator:
}TC,channel,label,a_coefficient,b_coefficent,c_coefficient

So for channel 2 which is the battery voltage where the the voltage comes from
10x:
}TC,Battery Voltage,0,10,0

> (snip) I've found no instance of even
> one of these packets appearing on APRS IS. Furthermore, AFAIK, only Bob's
> client supports this technique at all.

aprsworld.net support telemetry, telemetry coefficients, and telemetry labels.
You are right, they are few and far between ... but not non-existant.

```
mysql -hdb.aprsworld.net -uguest aprs
mysql> select distinct source from telemetry_coefficients;

Hi all,

Some more elaborate voice repeaters use auxiliary receivers and a voter
to extend their service area. The popular GE voter used in these
systems (and perhaps others) uses a 1950 Hz control tone and a matching
filter in the audio. This is not noticable on voice (ears are
wonderful!) but tears up SSTV. The picture quality will also be
degraded by audio distortion all too prevalent among repeaters.

A simple solution for local interchange is a simplex SSTV repeater
supported by ChromaPix and others. The equipment is simple but full
exchange takes twice as long.

Bruce Gordon N6OLT

Part 97 can also be viewed on the web a half a dozen placed for free as
well, print them out and you have your copy for the cost of the paper and
ink.
Just have to know where to look.

Nice list! Note that PI1APA, PI1APK are our DIGI_NED test digis, using
telemetry for reporting VSWR, selected antenna, Ice warning (temp below
zero or not) etc. through a simple LPT port interface. PE1DNN-2 is dummy
data, that's my test setup :-). DK5JG-2 is the guy from the telemetry
interface and the APRS thermometer (also with DIGI_NED).

I hope all this talk about telemetry will make other people enthousiastic
to have a go at it too, so that next time you do this query you get a long
list...

Kind regards,

Henk.

254. [aprssig] DIGI_NED 0.3.3

From: Henk de Groot <henk.de.groot@hetnet.nl>
Date: Wed, 11 Dec 2002 23:02:27 +0100
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-110626-2002.12.11-16.49.58--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello,

I released a new version of DIGI_NED, version 0.3.3.

If you don't know what DIGI_NED is, it is a dedicated digipeater, does not have a GUI but is very stable and good at its job (If you disagree, tell me what's wrong and I fix it...). It runs in DOS on cheap 286 class PC's (or better) and on Linux using all kind of modems, from cheap BayCom/BayPack and YAM modem to KISS TNC's and SCC cards. It can have up to 8 ports so can also act as a cross-band digipeater. The source is published under the GPL licence.

It has taken quite some time. In the mean time version 0.3.2 was durability tested. In our digi PI1APK this version ran for half a year without any interruption or malfunction of any kind. Is super stable software.

This versions contains a number of small but usefull addaptions. First of all the port number used by AX25_MAC are aligned with the numbers in DIGI_NED now. The old AX25_MAC still works, the new AX25_MAC checks if "version: 2" is present in the AX25_MAC.INI file to avoid problems.

Furthermore it is now possible to transmit beacons at fixed times. By changing the interval "10" for every 10 minutes to "@10" the beacon will be transmitted at every 10 minutes past the hour. Range is @00 to @59 but if you use for example @60 then the beacon is send every other hour.

It is now also possible to automatically start maintenance programs. This works with the new "automessage:" rule. With this rule you can at a specific interval or at a specific time automatically internally send a query to the digi. Since on the response to a query bulletins can be send, object posted and programs executed, you can automatically start maintenance programs to for example fetch kepler sets or to compensate drift of the PC clock. The digi reacts to the internal query as if it was send by anohter station, only direct responses to the originator are send to the screen.

Two new rules were added "digifirst:" and "diginext:". They work as "digipeat:" but make a difference if the digi due is the first in the digipeater list or not.

Finally some small problems were solved. The "whois" example didn't work anymore, for DOS is now works with a little qbasic program, so it now works without 'egrep' from the MKS toolkit. Now you can also see how it works an maybe more people will start experimenting with this now.

DIGI_NED should also compile again with Suse 8.0 and Slackware 8.0, due to changes in the ax25 package of Linux it didn't compile clean without manual changes. Now it should work again.

As usual the version has been posted to the dutch packet network as DNEXE033.ZIP. This version and the source are available on the web via:

http://www.qsl.net/digi_ned

or

http://www.homepages.hetnet.nl/~remko

Here are the changes from the Changes.txt file:

Changes.txt

29-11-2002 version 0.3.3
- Syntax and semantic fixes in the manuals and executables - provided by
   David, ZL3AI. Thanks David!
- Change in the satellite query response, when the satellite is out of
   range then the response contains the next AOS instead of only saying
   that the satellite is not in range.
- Change of the AX25_MAC driver. Port numbers in the AX25_MAC.INI file now
   start counting at '1' instead of '0'. The change is only cosmetic, if you
   use the new AX25_MAC driver don't forget to increment the port numbers in

your existing AX25_MAC.INI file. The driver will now check the version of its .ini file, look at the sample AX25_MAC.INI for the syntax. Reason for the change is that the AX25_MAC port numbering now matches with DIGI_NED's port numbering and its also more natural to start counting at '1'. Having the same numbering can prevent hard to find installation mistakes. The software API has not changed so DIGI_NED works equally well with the old as with the new AX25_MAC driver. This change of course only applies to DOS.

```
+----------------------------------------------------------------------+
| WARNING:                                                             |
| The port numbers in AX25_MAC now count from 1 instead of 0 to allign |
| the port numbers with the numbers used in DIGI_NED.                  |
| If you use version 0.06 or better do not forget to adjust your       |
| AX25_MAC.INI file. You can still use the old AX25_MAC if you want,   |
| function wise they are compatible. The new AX25_MAC checks if        |
| AX25_MAC.INI has the correct version number to prevent problems!     |
+----------------------------------------------------------------------+
```

- Problem with "!ptt" command. On screen the program said that the PTT was disabled, however it did not actually do it. Oops...
- Added ALT-B keyboard command which forces transmission of the beacons.
- After 1 minute of logging the logfile is now closed and reopend to give operating system a chance to update the file administration. This applies to the digi_ned logfile and the tnc logfile. This way the major part of the logfile is saved even when bluntly switching off the PC (or in case of a power interruption). Previously the logfiles would be empty in these cases because DOS only seem to update its administration after the file is closed. When exiting DIGI_NED normally this is not a problem, but it is when the PC is unexpectedly switched off. I don't know if this was also a problem for Linux - I don't want to jeopardize my filesystem to check this...
- The tnc logfile also contained non UI frames or UI frames with a PID unequal to 0xF0. Since the TNC log format is only for text UI frames this gave funny results. Now only UI frames with PID 0xF0 are logged, this are the APRS frames and not IP, NetRom and connection oriented packets.
- Added "~" to the "data_prefix:" rule in the sample digi_ned.ini. Now dupe checking on UIview messages are treated like APRS conformant messages.
- Added an #ifdef in mac_if.c to prevent inclusion of rose.h if a new ax25.h headerfile is used. Aparently this caused problems on an Suse 8.0 system. Don't know exactly why, but this should prevent it anyway. The new ax25.h header seems to include netrose/rose.h, but in the linux/rose.h file was not protected against this, which led to redefinition problems.
- Some output missed a <CR>, two error outputs had an extra <CR>. Thanks to David, ZL3AI, for finding and reporting it.
- Changed the template beacon to have an star with an overlay "D" for DIGI_NED as per suggestion of Bob Bruninga on june 23 2002 on the APRS SIG.
- Problem in monitor output when sending DX messages. It shows as destination port the port on which the DX was recieved, instead of the port to which the data is tranmitted. So it looked like multiple transmissions went to the same port. The real transmissions were however on the correct port. Found by Jaap, PA5JB, thanks reporting it!
- Modification to mac_if.c do that it compiles again on Slackware 8.0 systems. Thanks to Diego, IW1DGI, for reporting this and testing the fix.
- Repaired 'whois' example, it was broken after I added single quotes arround the query data (to avoid redirecton when a '>' appears in the query the user send). The DOS version now uses a simple qbasic Basic program instead of the MKS tooklit 'egrep'.
- New rule 'automessage:'. Enables to automatically send a message internally to trigger posting of objects, keep tracking running or to run programs at regular intervals.
- Rules 'send:', 'beacon:', 'wx:', 'telemetry' and 'automessage' can also use absolute time now. Add an '@' sign to the interval, the number now specifies how many minutes past the hour the beacon shall appear. Note that numbers above 60 will start skipping hours; i.e. @80 specified 20 minutes past every other hour.
- Added new rules "digifirst:" and "diginext". They work as "digipeat:" but "digifirst:" only acts if the digi due is first in the digipeater list and "diginext:" only acts if the digi due is not the first in the digipeater list.

APRS[tm] is a Trademark of Bob Bruninga,
his home page is at "http://web.usna.navy.mil/~bruninga/aprs.html"

Kind regards,

Henk.

I should have mentioned DIGI_NED, as I was aware of their tranmitting this format, however the two people that I corresponded to about this informed me that they did not use the coefficients, only the labels. Looking at the parsed values on James site, this appears to be unchanged. Is there some reason that you do not use the coeffient formula to, for example, scale the SWR to the "usual" decimal number?

Also, these two told me that they specifically set the path on these packets so that they would not reach the APRS IS, as they felt this was internal information, and did not wish it shared. Indeed, for both of these stations in PE, one did not have any telemetry on findU, the other did not have the label messages passing through. Perhaps I was wrong to consider all users would not wish to keep this data internal. James site did reveal a couple of people that are indeed using the formula, a DK (active, but only getting a few packets to the APRS IS a day) and a VK (not heard in the last two weeks.

Nice to see some use of this...

Subject: soundcard APRS?

What software would I need to do soundcard APRS? My buddy's TT2 took a hit, and he wants to use his laptop for a tracker temporarily for an event this weekend..

Thanks
Ken

Windows: AGWPE + an APRS program that talks to it. APRS+ does for
sure. Others probably do as well.

Linux: Soundmodem + Xastir.

>is today in a way....
>

Aside from the on-the-air spec which can be used to provide the basics, there is no provision, nor could there be. Too much information needs to be conveyed for many sensors to do so through RF APRS. As I say, I think that telemetry is largely "personal" information, meaning it is intended for insiders, people who have the knowledge to interpret it. The APRS Spec does a decent job of defining those things of general interest to people, things that are "everyday". Telemetry is more designed for unusual paramters that are followed across time at a single location. Take, for example, the classic telemetry example of voltage. I don't care what your voltage is compared to mine, I care about the way each changes over time (and in reality, I don't care a whole lot about your voltage).

Even if there is some way (e.g. the on-the-air method) to identify a telemetry parameter as a voltage and display it as a true value, that still has very little meaning. What voltage? How accurate is the calibration? What are the "danger" values? If you try to create a format that can cover every possible thing, you end up with a packet 100 bytes long for each data point.

>I.E.....   I've been working with seismic sensors (cheap geophones), passive
>IR sensors, and magnetic field sensors.... each are independent... so I have
>a sensor number I associate with each sensor to identify it (uniquely)...
>that works for me since I don't put this data on 144.39... but I see the day
>where it will be useful to put it on 144.39 (using the local digipeaters to
>relay the data to me and then I can monitor a car driving up my driveway
>(magnetic sensor)... person walking up my sidewalk (seismic and IR
>sensors))...   or even being able to note if it's deer or poachers that are
>hanging around the feeding point on my wooded property.... (four legs vice
>two legs are easy to differentiate with seismic sensors... by the walking
>pattern)... and given my sensor studies... I'd like to see and decode
>similar info from other folks sensors....
>

But even if I know it is a seismic sensor, I need to know a lot more than that (and its lat/lon) to make any sense of what I are looking at...do you see what I mean? A seismic sensor is not standard in the same way, for example, a wind sensor is (and yes, there are problems with the way some people implement these sensors, but the concept has a universality to it). On the other hand, very few people have such an understanding of a seismic sensor...you need "insider" knowledge beyond just the sensor type.

>So... should there not be an additional identifier field besides just T for telemetry? Frankly, one byte for 255 different sensor types would help (in my case... maybe not yours.... but maybe it'll help others who may have other types of sensors.... water temp, water level, ambient light (for cloud cover as well as algae concentration), water or gas or fuel pressure, depth, chemical detectors, etc etc etc)
>

You can add anything you want before the first comma, and the software won't care, as I said this is a delimited rather than position based format, so this won't break the software, though I don't see much use for this:

```
}THThis is a seismic sensor in my driveway,F23,A31
```

The only thing I'd see it useful for is something like PCSats telemetry frame, where there are 4 different sets of values sent with the same callsign.

>I particularly LOVE the 16 bit field... as many sensors these days are 10-12 bit sensors...
>

You missed the whole point, it is not 16 bit, there is no specification of size, it could be 1 bit or 512 bits! This is the flexibility my project required, and the beauty of this format...

>Seems like the approach you are taking (which I do applaud despite any impression from my above comments)... might cause a "tower of Babel"....
>
>It boils down to explicit data types (the extra ID byte... or XML) vice implicit... a particular field location in a string.
>

I could not disagree more, the whole point of this is flexibility, there should be nothing specified in this other than the number base (as in decimal or hex), anything else is up to the user. Nothing else explicit, and nothing implicit.

If you and others want to work on seismic sensors, you can define your own data types, and identify and classify your data all you want. Understand, I did not say I'm creating a data type that will answer everyone's needs, clearly that is simply not possible. The idea was to create something general enough that it would meet most people's needs, which seem to be transmitting numbers, nothing more.

>Just as in programming, I think implicit data types should be avoided... for the same reason....
>

Absolutely, which is why the only thing this approach specifies is the number base...which must be explicit (11 can be an number in anything from base2 to base infinity!). Nothing is implicit, this is just numbers. No units, no meanings other than what a recieving station chooses to attach. Once you say this is a temperature, now you have a whole bunch of attributes that need to be described (exact location, units, accuracy, precision, and so on). Sending just numbers avoids all this.

As to programming, that's why I like perl, there is no typing at all for variables, unless the programmer chooses to force it.

```
$x = 123;             # or $x = "123";  the results are identical
$y = substring($x,2); # use $x as a string
$z = $x + 1;          #  then use $x as an integer
print "y = $y   z = $z"
```

```
y = 23   z = 124
```

Meaning is determined by the recipient!

>But then again... I may misunderstand your approach.... I tried using different SSID's to identify different sensors.. but that's too limiting for wide sensor fields (lots of sensors).... and would never work when I use 11 ssid for magnetic... somebody else used 5 ssid for... whatever.... and I for one would love to see other magnetic field sensors (great for vehicle/train/aircraft detection)...
>

But even knowing a sensor is magnetic tells you litte. What is the distance from the detected object...obviously a signal of x is much more significant if the distance is 100 yeard than if it is 10 inches. What sort of object is it detecting? So you add another field to indicate it is a train, not car or aircraft . Still not enough, model or real train? Where do you stop? Who assigns and keeps track of all these codes?

Just about any Windows-based version of APRS now works with AGWPE. But I've found getting it to work with laptops is a dodgy issue. It really depends on the audio solution of the laptop. Plus AGWPE doesn't seem to run well on processors of less than 200 MHz and a multimedia (MMX or 3Dnow) processor is required. I will say that it works OK on my Fujitsu Stylistic 1200, which has a 120 MHz MMX Pentium processor.

MixW (the multimode sound card program) can emulate a multi-mode TNC like a KAM or PK232. Set to the "1200 baud Standard VHF Packet" mode, it does an absolutely superb job as a TNC -- it outperfoms EVERY TNC hardware or software TNC that I have ever tested.
 On Win9X the interface is a bit kludgy since it's TNC emulation outputs to a serial port. In turn you need to connect that port to another serial port, with a null-modem (crossover) cable, where the end application (i.e. APRS program) is expecting a hardware TNC to be connected.
 On Win 2K and XP, an optional software component (the Mix "serial port bridge") creates two virtual serial ports connected to each other. You then tell Mix to use one of the imaginary ports, and the APRS program, BBS app, packetcluster pgm or other end app to use the other virtual port. No physical ports needed. Note that the Mix softmodem data stream interfaces with an APRS application via a normal serial port in KISS mode, not via a ICP/IP connection as the AGW Packet Engine does.

The program displays the received packets in it's own window as well as echoing them out the virtual TNC so you can monitor the raw packets BEFORE the APRS program gets at them. Very handy for debugging on APRS. This is somewhat similar to using the Web browser monitor function in AGW.

I have used both AGW and MixW in many different computers and have found that MixW is much more tolerant of diverse soundcard hardware than AGW. Several systems that AGW wouldn't work on at all (or were extremely fussy about input audio level settings) worked flawlessly with MixW.

I've been running the Mix softmodem, APRSplus and Street Atlas 9 on a Win2K Celeron system for months now without a single hiccup.

I've used it with UI-VIew and APRSpoint as well.

Currently I use it in the 300 baud 200-Hz shift packet mode on 30M HF APRS. In the HF mode, you can tune the packet tone frequencies on a waterfall display, with a click of the mouse, just as you do on PSK31. Since the tones are fully variable, you can emulate the 1600/1800 pairing of a KAM or TNC2 in HF mode, or the 2110/2310 tone pair of a PK232 in HF mode at will.

The object is to share 2 serial ports. I've done this with the Internet Connection Share feature of Windows 98 Second Edition and Ethernet ports. It seems reasonable that the ICS could just as easily share serial ports and not need to do the hardware cable bridge you mention below.

Perhaps there are some 3rd party applications for Windows 95 and windows 98 (not SE) that could do the ICS in software too.

You do the same as with any ham soundcard application:

1) Use one of the serial port handshaking lines to drive a simple transistor
switch or opto-isolator.  Mix is extremely flexible in configuring the
handshaking lines of the serial port for PTT, CW keying (connect through a
transistor or opto-isolator to an /HF rig's CW key jack) and/or traditional
FSK keying for HF rigs with built-in RTTY FSK mode.

    or

2) Use a radio's VOX funtion to key whenever a tone is present

 or

3) Build or buy a vox-like tone detector as part of a external soundcard
interface that goes between the computer and the radio.  I have such a device
described on my website at:
    http://members.aol.com/wa8lmf/ham

Commercial soundcard interfaces such as the MFJ and Buxcomm Rascal (I don't
recommend the highly-overrated  Rigblaster because of it's lack of complete
isolation of the radio and computer) provide the serial-port handshake-line
keying.   The Rascal is available as a kit,  or assembed and wired for a
particular radio

The Tigertronics SignalLink provides the tone-keyed VOX-type function similar
to my homebrew, and is inexpensive ($50) .

Note that all these intefaces are basically just a pair of audio transformers
(one for souncard line-out-to-radio transmit-audio   and one for
receiver-audio-to-soundcard-line-in) plus some sort of ckt to do PTT.

263. [aprssig] PCsat Special Store/Forward TEST

From: Bob Bruninga <bruninga@usna.edu>
Date: Thu, 12 Dec 2002 13:40:19 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-110779-2002.12.12-13.25.32--lyris.aprssig#tapr.org@lists.tapr.org>

Rendered body type: text/plain

```
Operators of D7 or D700 outside of Europe and USA:

PCsat is still fully functional and so we can continue the "Priority"
store-and-forward test to let HT or Mobile users anywhere in the remotest
areas of the planet to report their position and status.

To do this, a wilderness traveler simply sets his TH-D7 or TMD-700 APRS
radio to select a "PRIORITY" or "SPECIAL" or "CUSTOM" flag in their
position/status packet.  Then set their beacon to once every 5  minutes on
the special travelers un-published PCsat uplink frequency.

Any special, priority, emergency, or custom position/status report will be
stored and repeated once every 3 minutes on the 144.39 downlink.  When
PCsat flies over the USA with dozens of IGates listening on 144.39, then
the network will capture it to the http://pcsat.aprs.org web page for all
to see.

If you live OUTSIDE of Europe or USA in a remote area of the world and
just happen to have an APRS HT (D7 or D700 mobile) and can participate in
this test, please let us know.

Thanks

de WB4APR@amsat.org, Bob

Subject: Re: PCsat Special TEST

I checked today and PCsat is still in the ABEACON mode, meaning it will
beacon down on 144.39 once every 3 minutes a single copy of the
last three EMERGENCY, PRIORITY, SPECIAL or CUSTOM packets it receives from
a D7 or D700 kenwood APRS radio.  If you have such a radio, it would be
nice if you put it into APRS beacon mode and transmitted SPECIAL packet
once every 5 minutes for many days.  If we see it here in North America,
then the store-and-forward part of PCsat is working!

Bob

> > > If you have a spare Kenwood D7 or D700, we have a great opportunity to
> > > do a test.  I should have thought of this before. PCsat has a

```
We are planing a cross country trip in a week, as far as I am to understand
the 144.39 is used country wide.

My question is that if there is any exception to this rule?

We will start out from Phoenix AZ  and we will be going to Huntsville
Alabama then on to Bergenfield New Jersey. I-40 or I-10 to AL, depends on
weather.

KD7KYO-2 wife's car. We are planing to leave next Thursday afternoon, we
will be monitoring 146.52 and/or the local IRLP machine.

The frequency is used country-wide but the optimum path isn't.

In the mountainous southwest (CA NV and AZ) WIDE2-2 only is used. Not sure about NM. East of the Rockies, the path will probably be RELAY, WIDE2-2 (or if the digis in the area don't respond to the callsign substituting WIDEn-N construct, RELAY, WIDE, WIDE) .

You will probably need to monitor local activity for the paths in use and adjust yours accordingly.

> hunk of crap.

The path issue is driven, not by your TNC, but other TNCs that you expect to digipeat your transmission as you travel.

The WIDEn-N construct is an APRS-specific addition to the traditional packet path convention where each digipeater actually changes the path; ie. digi 1 hears WIDE3-3 and changes it to WIDE3-2 on retransmission, digi 2 hears digi 1 and changes it to WIDE3-1 on retransmission, etc until the call is "used up (WIDE3-0).

The WIDEn-N path can have a maximum starting value of 7. WIDE7-7 is strongly discouraged under normal conditions since a single transmission can triggger an expanding "chain reaction" of hundreds of retransmissions from an ever-widening circle of digipeaters in surrounding areas.

A digipeater's TNC has to be running APRS-specific firmware (or be connected to a computer running APRS software) for WIDEn-N to work. [Presently only recent versions of the KPC3+, KAM and TNC2 with specialized firmware do this solely in hardware.]

In some areas, old TNCs [PK232s, original TNC2, etc] not WIDEn-N aware, are doing APRS digi duty. These devices will only respond to plain old WIDE. In such an area, WIDEn-N paths won't do anything since the digi TNC won't see it as a "legal" alias.

Since WIDEn-N aware systems will also respond to plain old '"WIDE" (and most WIDEs outside the southwest also will respond to "RELAY"), the most universal path would be something like RELAY, WIDE, WIDE [equivalent of RELAY, WIDE2-2 on a "smart" digi] or RELAY, WIDE, WIDE, WIDE [equivalent of RELAY, WIDE3-3 on a "smart" digi] . The disadvantage of this is a longer packet on each transmission which ties up more channel capacity, and increases the chances of a collision with another packet.

Rendered body type: text/plain

Hi Folks,

I just downloaded the lastest version of APRS CE Build 1.0 and it worked for about a day or so and than stopped reading the GPS data. I hooked up my Palm IIIxe and tested the GPS and radio and it worked fine. I even hooked the laptop and it also worked fine..

I see the GPS sending the data but not in a format that the CE 1.0 understands. I force a position xmit and it shows all zero for the expection for the time.

It worked fine with the old version of aprs 0.99. Of course you cant go back now.

I am using the Alinco dr-135 and GPS-16. I was using the D7a init file and it work fine for months.

Any help would be appreciated.

I love my IPAQ and would love to register the CE version if I can get this to work again..

Angelo

James,

I am using the RS-252 with the KPC3+ (v8.3 firmware).

You will find a good working wiring diagram at K4ABT Buck Rogers' site:
http://www.packetradio.com/!TNCables/KNV2RS252.gif

This shows the RS-252 and external speaker to TNC wiring. You need R1 and C1 to make this work.

One "undocumented feature" I found with the RS-252 is on power up it defaults to the frequency in the VFO, not the last displayed memory. When you turn the radio off then on again, it is ready on the VFO. Operate your APRS package with the 252 rotary on/off control in the ON and set for close to MAX audio. I turn everything on from an external power switch and it remains on the last displayed frequency. Put the APRS (working) frequency in the VFO.

You will need the Microphone to make ANY programming changes so keep it close to the radio. Put your favourite packet and voice frequencies in memory so you don't have to reprogram on the road.

I hope this info helps you get on air soon.

Regards,
Ian, N3CVA-9

IMO I would say every 10 minutes. Figuring that you will travel 10-12 miles
in that time frame.   To me thats often enough to be heard be all digies
that will come acrossed. I'll Log KD7KYO-2 station as they travel and see
how well tracking is. If they travel on I40 I'll try to catch them as come
into 520 simplex range. If you where Flying then a faster beacon rate might
be a good idea with a short beacon path.

That is an excellent question, I too was wondering about this myself.

Currently since we do 99% tooling around town I have:

```
BEACON EVERY 9 min
BKONDEL ON
BLT 1 EVERY 00:01:00
BLT 2 EVERY 00:05:00
BLT 3 EVERY 00:00:00
BLT 4 EVERY 00:00:00
BREAK OFF
BTEXT 146.52 or Local IRLP Node KB7TBT@QSL.NET
```

Hi pat!

Thanks! that would be great for us, I was wondering if there was a way to log the entire trip in some way.

I would think 10 min is a long time span, for basic "look at me" tracking I guess it would be fine but if everything came crashing down, 10 to 12 miles is a great distance for someone to find you. In case of a packet collision or a LOS then you are talking 25 +/- miles. Maybe a 3 to 5 min time frame. I will wait for the consensus and take the average from that..:}

FYI: The weather for the Southwest is not looking good come Tuesday, Wednesday and Thursday, flagstaff and NM will be under snow so we may change to I-10 just to stay out of the mess. Of course the I-40 or I-10 route is subject to change, I wish I could stamp it in stone for you but it is winter and I wont know for sure until I start the car.

We will be on whatever local IRLP or 6.52 so feel free to give us a call, depending on who is driving I think it would be exciting for the wife to be contacted all over the country just to say hi.

Thank You! Thank You! Thank You!

I don't know how I missed this, I have gone all over that site and never found it.

I am aware of the VFO issue with the 252, it is a cheep radio and you get what you pay for. I do have it set to 4.39 in the VFO mode, I will not be using the radio for voice anytime soon but I did save the mic and I did buy a separate connector for the wiring so I could just pop the mic back on and do whatever is needed.

I am a big fan of direct freq. input radios, when I walk into HRO to get something new that is one of the main things I do look for. I do have 1 other radio that is NOT direct input and there is times it drives me nuts, the Alinco DR-605 is in the car so I have most of the local freq.'s programmed to make life simple.

Actually I have 2 radios that are not direct input, but the Icom IC-551 6M All Mode does not count...HI HI.

Rendered body type: text/plain

Hello Everyone,

My name is Michel Castejón. I'm KC8UFL.

I am new to the list and I trying to get into the HT to satellite APRS bandwagon.

Two questions:

1) PCsat operation with the Kenwood TH-D7A(g) HT, doppler and minimum step size.

The minimum step size I can set for my TH-D7A is 5.00 Khz. How do I account for doppler shift and what frequency should I use?

145.825 Mhz or 145.830 Mhz. When I got up this morning to try to catch a 22 degree elevation pass of the PCsat my satellite tracking software said tune into 145.827 Mhz ... Well ... I couldn't.

2) Antenna ....

I am using a Pryme RD-98 antenna for my HT. If my intention would be to test PCsat with the HT should I look into getting a better/different antenna.

I am going to try and see if I can get to PCsat from Caracas, Venezuela later this month.

CCS CARACAS, VENEZUELA   10 30 N 66 56 W

Thanks a lot and 73s,

Michel C. (KC8UFL)

Hi,

I know that most APRS users seem to be using Garmin GPS's but I got this fantastic deal with this Magellan MAP330 GPS. I use it for Geocaching.

I would like to use this GPS with my Tiny Trak II and was wondering if anyone can tell me what NMEA selection should I use. The selection that the GPS offers are V1.5 APA, V1.5 XTE or V2.1 GSA. Also what would the Baud Rate setting? 1200, 4800, 9600 or 19200?

Thanks for any info.

Jonathan,

I have been using a tracker for several years. The goal on a road trip should be to get one successful packet into the APRS IS whenever you are near a digi. This requires a high packet rate. Just remember to turn off or reduce the rate when you stop. Or use a Tiny Track.

I recommend a rate of no less than every 3 minutes if the rate is static; every 60 seconds is workable if and only if you can turn the tracker off or reduce the rate when you make stops. I define a stop as any time I am not going to be moving again for one hour or longer.

If you are using a Tiny Track like I am I recommend setting the fast rate at 60 seconds when over 60 MPH. The advantage to a fast rate on the road is that you are through a town and gone before you send more than 3-6 packets this is hardly enough to cause a problem yet this greatly increases your rate of success. If you send only one packet when you are near a town the chance of success is minimal. The average traveller is through a town in less than 10- 30 minutes depending on the size and traffic. If you send dozens of packets out in the boonies who cares no one hears them.

I highly recommend the Tiny Track. I also recommend that you investigate Smart Beaconing. It is an option in APRS+ and PALM APRS. I don't know about the other programs. Smart Beaconing allows a packet rate adjustment to occur automatically as speed varies the rate declines as speed drops. It also triggers a packet when you change direction. I have two settings in mine for the slow rate. One beacons every 30 minutes at any speed less than 10 mph I use this for weather spotting. The other setting beacons once every 18 hours at speeds below 30 mph I get some beacons around town and lots more when on the Interstate.

The key as I see it is to try to be polite; beacon as much as needed when needed and very little at other times. The one thing that gets APRS'er dander up is the guy who stops at a motel and sends a beacon every 30 seconds all night.

On the subject of paths I normally use these two:

APRS VIA RELAY,WIDE,WIDE
APRS VIA WIDE,WIDE2-2

I sometimes substitute TRACE for WIDE so that I can see the path data.

I often run ALogger at home and capture the data from the internet and then play it back in APRS+. Great way to find the holes in the coverage along a major Interstate. Turn off the time logging in ALogger to make the files easy to handle.

Xastir has Smart Beaconing as well.

I also highly recommend the TinyTrak-II, but I made a few mods to mine to make it stand up to more abuse.

Smart Beaconing _really_ improves your track without cluttering up the airwaves with too many packets. It reports changes in your course. If your course isn't changing much, it beacons at a timed rate based on your speed.

This is true but how many times do you need to get into the same digi?

>This requires a high packet rate. Just remember to turn off
> or reduce the rate when you stop. Or use a Tiny Track.

The thought I have here is that the more you transmit the more unstable the
local

network will become. If you can send 3 packets within range of a digi your success
is likely.

> I recommend a rate of no less than every 3 minutes if the rate is static;

This is reasonable. however you might consider the length of the trip. If your
simply going across a state (400 miles or so) Three minutes might still be excessive
Just in the local network here in Arkansas about 75% of the Interstate is covered by
digi reception with 10 watts or more. I realize that a few of our digies have great
reception. But still you can count on a weak digi having a range of 15 to 20 miles
or so. The better digies will go 50 mile or so. In the end you will have about a
40 minute time frame to hit a digi when going through a town. If you are traveling in
a remote area then you might need to increase packet rates. However if the area only
offers a slight chance of hearing you, then by getting in really does on show how reliable
that area is.

I believe the dig range is what you need to be thinking about not the size of the town.

>
> I highly recommend the Tiny Track. I also recommend that you investigate
> Smart Beaconing. It is an option in APRS+ and PALM APRS. I don't know

UI-view has a feature that allows you to beacon every N minutes or every N miles.

>

>

Hmmm you might consider the local network load too. Politeness might also be
looked at as which packet is more important. The guy who is trying to make a contact
to a station through a digi or the one who is passing threw town. One problem with
setting a tracker up with a fast packet rate is that you can't monitor the frequency to
see what's going on. What if you drive into an area where someone in trouble is trying to
get help. You might become harmful interference. Most programs are set so that they
send the same packet in one minute spacing until they get an ack. That should also be
considered. You might think about spacing your packets so that they will not resend on
a 60 sec interval for 3 minutes or so, this will help other stations to have a chance to get
into the network.

I use a THd700 in my truck and Pocket PC at least any other time I have a APRS station
up. This allows me to monitor what going on. Thats not to say I only have an APRS station

running while I'm looking at it. But I feel I should alway have away to see
whats going on with it.

Not sure about the 330, but I have a 310 and it outputs at 4800 baud.
Don't remember with the 310 but dont think I had any options. I was able
to get it to work with both my mfj1270c and an old tinytrak(I think that
is what it is anyway). Took a little fiddling with the tnc settings but
was doable.

Gee, I thought the whole purpose of a mobile tracker was to show that a
station is moving, in what direction, and current location. One packet
isn't going to do that.

>The thought I have here is that the more you transmit the more unstable the
>local
>network will become.

Balderdash...

>get help. You might become harmful interference.

Balderdash again and a specious argument. A visiting out of town mobile
ham should always take precedence over a local resource.   The locals
already know where "Jim's" fixed QTH is.   We also know "Jim's" route that
he drives to work everyday already...

Although a "local" may be in an emergency situation, he should have other
resources he's aware of that aren't APRS based. Voice repeaters,
autopatches, cell phones, payphones and the like.

As a digi owner/operator I encourage everyone in the Sioux Falls area to
beacon as often as they please, especially out of towners passing
through. It's nice to see you!   If you feel like beaconing at 30 second
intervals more power to ya.   Crank up the RF as the tower's still too low. ;)

73,

Mark

At 02:09 PM 12/13/2002, Pat Karp wrote:

>This is true but how many times do you need to get into the same digi?

Depends on the application requirements. A blanket statement of "once" is probably wrong, depending on circumstances.

>The thought I have here is that the more you transmit the more unstable the
>local network will become.

This is unlikely to be true - networks are designed to be used. If your local network is so fragile that one additional tracker transmitting once per minute causes it to fall down, it's probably time to work on your network.

>But still you can count on a weak digi having a range of 15 to
>20 miles or so. The better digies will go 50 mile or so.

I really question these range estimates. Data transmissions have far more demanding S/N requirements than a voice repeater. Your voice system might not even notice a momentary 10dB fade, while the same fade will completely destroy a data packet.

Trackers range in power from 5 to 50 watts, and I'll pretty much guarantee your "50 mile" digi isn't picking up a tracker built around a TinyTrak and an HT with a 1/4 wave magmount antenna at that range. Not everybody has a D700 in the car.

>Hmmm you might consider the local network load too. Politeness might also be
>looked at as which packet is more important. The guy who is trying to make
>a contact to a station through a digi or the one who is passing threw town.

The guy passing through town will be out of range in a few minutes, while the guy trying to make a local data contact can easily retry.

Also, I'm curious how you can tell that one particular packet is more important than another.

>One problem with
>setting a tracker up with a fast packet rate is that you can't monitor the
>frequency to see what's going on. What if you drive into an area where
>someone in
>trouble is trying to get help. You might become harmful interference.

If we carry this to it's logical conclusion, then you should NEVER transmit, because you might step on somebody who is in trouble and chose that exact instant to transmit as well.

Besides, you're only "harmful" interference if you interfere deliberately. Otherwise it's incidental interference, which the network will deal with correctly (and we as hams have to accept).

And, most trackers monitor the frequency just fine on their own. Do you actually LISTEN to the frequency and then give your tracker the command to transmit? Or do you let the trackers and digis handle transmit timing on their own?

Better to worry more about the number of "WIDE" the tracker is using. "WIDE5-5" is going to have way more impact on the regional network than "WIDE2-2", regardless of the power of the tracker.

A single Mic-E packet or position packet shows all of this for a moving vehicle.

I take it, Mark, that 144.39 in Sioux Falls is not running anywhere near capacity. It is in the DFW area (100+ stations on at any one time). The original author's statement is correct and shows an obvious concern for operations in highly congested areas.

> Balderdash again and a specious argument. A visiting out of

Didn't realize that visitors "always" take precedence over resident operators. Guess I missed that in the ARRL Operating Guide, the FCC regulations, etc.

> Although a "local" may be in an emergency situation, he
> should have other
> resources he's aware of that aren't APRS based. Voice repeaters,
> autopatches, cell phones, payphones and the like.

So, doesn't the visitor also have other resources available to them?

APRS, as Bob has said many times, is a tactical protocol. Everyone has equal precedence and the protocol is designed for local transmission (UI protocols quickly run out of gas with multiple digi'ing). I agree that visitors should be encouraged to use local amateur radio resources, including APRS. However, that doesn't make a visitor any more or less important than the local operators.

> As a digi owner/operator I encourage everyone in the Sioux
> Falls area to
> beacon as often as they please, especially out of towners passing
> through. It's nice to see you!   If you feel like beaconing
> at 30 second
> intervals more power to ya.   Crank up the RF as the tower's
> still too low. ;)

But don't do that down here in the DFW area where our APRS frequency is already running above reliable performance. I was glad to see so many others on this SIG stress operations that are considerate of other operators in the area. We might all take a note that courteous operation is something that we all can respect and enjoy.

Agreed! and Mark's right about the traveller being more interesting than the local guy's qth or route to work. Not only is the traveller something new to look at, but he can also benefit from voice directions on a local repeater if he's lost and I can use aprs to guide him to his destination. Plus, you gotta consider mobile stations have flutter and multipath. When moving, the likelyhood that you'll actually get into a digi is just too slim to TX every 10 minutes. As an example, when I lived in savannah, we had a digi that was on a local hospital which was located about 8 miles from i-95. All the folks up and down i-95 on their way to florida didn't stand a chance getting to our digi with a 10 minute rate b/c at best they could get within 8 miles of it and it wasn't that high anyway. We were lucky to cover 20 miles of i-95 with it, and that gave them 2 chances to hit a digi. Not too good.

Off hand, I'd say a TX interval of 60 seconds to 3 minutes is a good general range. Also, on my wife's car, I used to have her TX every 20 seconds with no path at all (simplex range). Since I'm the only APRS'er in this town, it's not bothering anyone.

Wes

I beg to differ. One packet does not take into account traffic conditions, chosen route, or many other variables. I can see someone heading north from say Beresford, SD- but when they get to Sioux Falls proper, they could continue north to Fargo, turn east to Minneapolis, or head west to Rapid City. One packet and we'll never know. If they beacon at a 10 minute rate and miss one packet because of ground clutter they could very well pass through and never be heard again...

So? Is that the concern of someone from Phoenix driving through? No. Packet collisions are a part of the equation. It's not like the guy is dialing a 911 operator every minute to every local PD as he crosses the nation...it's APRS. Stop trying to make it more important than it is.

Another ham here pointed out that he's amazed at how little many hams here realize what is considered polite in society.   I have never lived in Arkansas or Texas, but in the 4 states I've lived in, guests are always served first, and they're expected to take the biggest/best cut of meat and the best potato (or the biggest hunk of lutefisk and the extra lefse).   Also it is considered rude to hand a visiting guest a hammer and a bag of nails and ask him to re-shingle your roof.   By the same token, hams driving through an area where they going to use "your" resources for a matter of minutes or hours should always be given the courtesy of having digi time.   You can probably put that keyboard to keyboard QSO off or do it on a different frequency, but that guy is gonna be in your area at one point in time and space.   And as has been pointed out - don't blame the one time user for your network woes.   The whole purpose of having one frequency nationwide was for travellers.

Furthermore, if a person is travelling they may not have the equipment or ability to rapidly adapt to local circumstances. I would much rather someone not familiar with the local freeway to keep his hands on the wheel and his eyes forward, than to try and change his beacon rate with a laptop while travelling at 70 MPH in the name of courtesy.

>So, doesn't the visitor also have other resources available to them?

Nope.   Don't be silly. These are people from out of town.   I know what gas stations are open late around here and which ones have awful gas. I know the travel information phone numbers, and I know where the hospitals are.   How would somebody from Phoenix or LA know that?   They may be able to find the hospital on a map, but do they know that 22nd street is closed because they're putting in a water main? Do they know 54th Street North from North 54th Street.   And you'd think Gateway would be on Gateway Boulevard, but it's across town...

Or how could they know that a listed repeater with autopatch is offline temporarily because they're replacing the water tower it was located on or that it has changed frequency?   And even if they did know the local autopatch code and routine, who could they call locally at 2 AM? I also know where cellphones work and where they don't.   I know where the Walmart is and the best places to eat.   We have enough people from Iowa crashing into things around here when they get into "the big city."

Again, is that the fault of a guy who passes through, once a week, once a month, once in a lifetime? No. The whole purpose of having one frequency is for people travelling from city to city.   I haven't operated APRS in a vacuum.   I started out in Phoenix, and have run APRS in Minneapolis and SoCal. The problems there aren't caused by the tourist, but by the locals who drive the same route to work everyday and beacon at insane rates, the guys who each have to have a weather station even though they're 4 blocks apart, and in Minneapolis the fact that everyone with a home station has digipeat enabled...

I still hold that the guy driving from Perth Amboy to Pismo Beach should set his beacon rate at 1 to 3 minutes and crank the RF up to 30 or 50 watts and let the locals worry about the details.   Enjoy the ride. Ham radio is a hobby.

Ouch... 10 minutes? That's more like 16-17 miles to me. Especially when I'm making midnight runs (like Dallas-Austin), I'll run a 60 sec beacon rate with a WIDE5-5 path from a D700 using a ~5dbi gain antenna. Considering most of the packets transmitted at night are fixed stations broadcasting weather data (the digis that ID every 3 minutes or so and don't broadcast any weather data are another topic for discussion one of these days), it doesn't bother anyone, and it's nice to be able to make it in to both cities via RF.

But that's not what you said, you only said "...moving, in what direction,
and current location." A single (properly formatted) packet will do just
that. Plus it helps if you have DR turned on!

Neither did your original statement. Your original statement was "the
whole purpose of a mobile tracker was to show that a
station is moving, in what direction, and current location. One packet
isn't going to do that." My statement regarding Mic-E's and position
packets is accurate.

> So? Is that the concern of someone from Phoenix driving
> through? No. Packet collisions are a part of the equation.

Why shouldn't it be a concern of someone passing through. I try to be
courteous wherever I am.

> It's not like the guy is dialing a 911 operator every minute to every
local PD as he
> crosses the nation...it's APRS. Stop trying to make it more

I'm not. I am saying that courteous operation and consideration for
local conditions should be part of any operators equation.

> Another ham here pointed out that he's amazed at how little
> many hams here
> realize what is considered polite in society.   I have never lived in

Your dissertation is nice, but it has no bearing on the conversation
(hence snipped).

> hams driving through an area where they going to use "your" resources
for a
> matter of minutes or hours should always be given the courtesy of
having
> digi time.   You can probably put that keyboard to keyboard

Never said they shouldn't. Just that they, as "guests", also should be
courteous in their use of such resources.

> QSO off or do it on a different frequency, but that guy is gonna be in
your
> area at one point in time and space.   And as has been pointed out -
> don't blame the one time user for your network woes.   The whole
purpose of

Wasn't blaming anyone. But, the single traveler becomes many travelers
(in our area) and they aren't operating in a vacuum. Again, courtesy is
something that all operators, local and visiting, can show.

> Furthermore, if a person is travelling they may not have the equipment
or
> ability to rapidly adapt to local circumstances. I would much rather
> someone not familiar with the local freeway to keep his hands
> on the wheel and his eyes forward, than to try and change his beacon
rate
> with a laptop while travelling at 70 MPH in the name of courtesy.

I agree. That is why, as was the reason for this thread starting in the
first place, operators should think ahead and attempt to be a "good
operator" wherever they are.

> >So, doesn't the visitor also have other resources available to them?
>
> Nope.   Don't be silly. These are people from out of town.

I always carry a repeater directory. I also seldom have QSO's on
repeaters in distant towns because my call is seldom responded to. But
it does not mean that I don't have access to those resources. APRS is
just one more. No more or less important than the others.

Again, nice dissertation with nothing to do with the thread (snipped).
This thread is about settings to use while traveling across country.

> > > through. It's nice to see you!   If you feel like beaconing

>
> Again, is that the fault of a guy who passes through, once a week,
once a
> month, once in a lifetime? No. The whole purpose of having

No fault was ever implied. But, while that person is in the DFW area (2
hours minimum to traverse and move out of direct digi range), the person
beaconing every 30 seconds from a mobile is effectively disrupting the
frequency for the other 100+ users in the area.

> I still hold that the guy driving from Perth Amboy to Pismo Beach
should
> set his beacon rate at 1 to 3 minutes and crank the RF up to 30 or 50
watts
> and let the locals worry about the details.   Enjoy the ride. Ham
radio
> is a hobby.

And I enjoy it. 1 to 3 minutes is a big difference from your previous statement of 30 seconds.

BTW, I set my mobile beacon rate to every 3 minutes. While in the DFW area, my path is RELAY,WIDE1-1 (to possibly help some TNC's keep from ping-ponging). My path while traveling (except in the SoCal area) is RELAY,WIDE2-2. My path when flying cross-country is WIDE2-2 except over Iowa where it is WIDE,WIDE due to the statements that most of their digis do not support WIDEn-n. Also, while flying, my beacon rate is 5 minutes (averaging 16 miles between beacons).

Don't take my comments personally, Mark. They weren't meant that way. However, your statements could have been construed as "all gloves are off" when you travel. The net of my statements is "courtesy is appreciated everywhere, regardless of whether you are a visitor or not."

Well, you can nitpick all you want. "Properly formatted" is a matter of equpment and choices - not every APRS enabled piece of equipment can do that. I have my KPC3+ set to only send raw GGA. Dead Reconing is only good for boats and aircraft. I think that it's been shown that DR is detrimental in urban environments. Again, go back to my Sioux Falls example. If someone is heading north to SXFL on I-29 and they turn east or west and that packet is not picked up, DR will put them heading to Fargo or Canada. That will not be corrected until the station reaches say Minneapolis or Rochester, MN to the east; or Billings, MT or Casper, WY to the west. That's a huge error.

You know, you're arguing both sides of the fence. Pick a side. I maintain that an out-of-town travelling station should beacon between 1 and 3 minutes and at 30 to 50 watts if he's got it. Obviously turn off the

tracker or reduce the beacon rate when your parked for any length of
time.   I don't care what common operating practice is for a locality or
their "network load."   Set and Forget.   I can guarantee that even in a
large city if you beacon at one minute intervals with no packet traffic
that only a fraction of your packets will be digipeated.   Why should I
care that some guy in Dallas gets his blood pressure up because he saw 15
digipeats of my mobile in a 60 minute period?   I'm passing through...

I think Directway is the Satellite delivered product- whats going south
is the copper dsl service. At any rate puts findu.com into a fluid
situation.

As I pointed out, repeater directories can't take into account changes in between publishing dates. Again, resources aren't just hardware, they're knowledge of local people, terrain, roads, and the like. Someone pointed out the specious "emergency" scenario. I'll pitch one. I'm pretty sure you'll refer to this as another "off topic" dissertation in another attempt to denigrate me...

If I'm driving around Sioux Falls and get caught in a white-out blizzard and get stuck in a snow bank, I can call (on a cell phone or Ham radio) one of half-a-dozen local people with a 4WD vehicle (or farm tractor) to come get me. I'm pretty likely to be able to describe well enough to a local my general location - roads, buildings, geographical or engineering prominences... "Hey Steve, I'm stuck in a snowbank somewhere south of town where Louise turns into a two lane road near 290th street. Come and get me please..."

OTOH, let's say Joe Ham is driving from Canada to Texas through Sioux Falls. Just as he hits the south side of Sioux Falls he gets into a white-out situation, get lost and off the main road and wedges his sedan into a snow bank and can't get his engine restarted - It's 2 AM, and the wind is blowing 60 MPH and it's 20 below zero (without the wind chill). He has a cell phone and calls 911 - he get's the Minnehaha or Lincoln County Sheriff's department. Ok? We don't have E911 and the driver only knows he's on a 2 lane road somewhere between Sioux Falls and Beresford. Now how are the Sheriff's gonna find him before he freezes to death? This guy has a blind APRS tracker, but before he left on the trip someone in Texas/Arkansas told him he should only beacon in ten minute intervals and at 5 watts to be courteous. He's cranks the RF output up, but he's in that dead spot between the Sioux Falls and Beresford Digi's- two minutes driving either way and he'd be able to hit one or the other. Had he been beaconing that way prior, we'd know within a mile or so what his location is...

Sound unlikely? Something like this happens almost every winter around here (without the APRS).

>Again, nice dissertation with nothing to do with the thread (snipped).
>This thread is about settings to use while traveling across country.

And that's what I was talking about.

Yup, looks like trouble, they say 30 days is the minimum time the service will stay up.

Two things I want to discuss. First, if Guy cannot get the backup server running in the next week, he needs to do the right thing and transfer it to someone that can immediately. It need to be up before I lose that DSL line, no excuse can be tolerated at this point.

Second, since Telocity was the only residential provider that could provide a fixed IP, I'll need to move the primary box to another site. In the past I had avoided this, because the box was my development machine, but now with Mac OS X capable of handling development of findU, I can part with the server.

I had a bunch of offers the last time the subject came up, but rather than try to dig up those emails and see if any offers are still open, I'll just ask. If you have a site that could handle the server (it is a minitower), let me know...the things I'm interested in are the authority (i.e. do you own the site or just think you can get away with it!), bandwidth, backup power, and physical security of the site.

Thanks

Steve K4HG

On Fri, 13 Dec 2002, Jonathan R Brockmeier wrote:

> On this same line, if you are on a trip, what is the polite gps position
> report time?

It depends on everything, mostly path...

1) No APRS digis heard, (APRS dead zone) then every minute for sure...

```
   At 60 MPH and with simplex range mobile to mobile limited to about
   2 to 5 miles MAX (remmeber packet tollerates absolutely zero flutter)
   If you dont beacon once a minute you can pass someone going the
   opposite direction and completely miss them...

   Path doesnt matter...

2) APRS area, but little activity mountain digis, once a minute 3 hops

3) Same but a busy channel, every 2 minutes or 2 hops

4) Busy area, 3 minutes 2 hops

or something like that...

bob, WB4APR

Are you serious?  If a guy is in this kind of situation why not take a look
at his gps
and state the coordinates?  Not only that he most likly knows the road hes
on or was on
and the local aprs station has record of him eather 5 minues ago or will
hear him
five minuts from now. shoot by the time the sheriff has a chance to
look(maybe not
in Sioux Falls but in most of the country) at an APRS station to get a look
the guy
would have sent another beacon.

BTW I dont beleave I sayed anything about 5 watts.  Seems how I'm the guy
from
Arkansas!  You seem to think that APRS through out the country is the same
as in
Sioux Falls.  Sorry but that is not the case.  I would hope folks everywhere
would
tolorate such activity but I don't think anyone anywhere would consider you
courtious.

Rendered body type: text/plain

I have been doing some listening and tracking of the International Space Station. In order to see where it is I go here:
http://www.findu.com/cgi-bin/find.cgi?iss

I found this site that shows where it should be and predicts where its going. http://liftoff.msfc.nasa.gov/temp/StationLoc.html (Go over to "J-track 3-D" and you can see any sattilite you want).

If you pull both of them up in different windows and compare APRS does not agree with the others tracking.

I understand there is an APRS unit on ISS. What freq. does it operate on? If it changes from time to time where can I find the present up and down link freqs. For now I just want to listen to the APRS on the ISS and be able to predict where its going to be with out loading in a bunch of Keps.

I said if we're gonna make specious arguments... BUT

You guys make a lot of assumptions... Not everyone runs a tracker with a GPS display. It seems to me Radio Shack sells a $99 GPS engine. My car has a Garmin GPS 36, I also have a Rand McNally GPS engine. I don't see a display on any of those. I'm not sure I want a GPS with a display in my car. They use more power, they don't auto-on, and it gets cold enough here to destroy an LCD panel. Garmin even put out a notice on this with at least one of their GPS products.

Also, not all Public Safety departments are trained or equipped to handle coordinates given by GPS. At least one ham has related such an incident on this SIG.

> Not only that he most likly knows the road hes
>on or was on

>would have sent another beacon.

Again, you make a lot of false assumptions. You make the mistake that beacon rate = successful digipeat rate. Going again to your suggestion of 10 minutes between beacons means a single missed digipeat means 20 minutes between your next attempt. You can go pretty far in a car in 20 minutes. As I have pointed out it's a routine occurrence in this part of the country for motorists to get disoriented in bad weather. You get outside of the city and there are no distinguishing landmarks to give you any reference point. No streetlights. No visible sky. No mountains. We even have people get lost in good weather, and get into a disabled vehicle situations and it takes days to find them. It happened this summer. And that assumes that you've just gotten disoriented and disabled. It's really easy to injure yourself. Dick Cheney was up here pheasant hunting last fall and the Secret Service drivers rolled one of their big SUV's on a country road, and these guys are professional drivers...

A few winters back we had a lady get lost in a blizzard and they managed to DF her after several days and about 15 minutes before her cell phone battery died (If I recall correctly she was on the phone with our Governor at the time). She was very lucky. You guys in Southern States don't understand snow, cold, and wind; how it alters your perceptions and clouds your judgement. People think their in one spot and when they're found it's miles from that...

Last winter we had a college student disappear on his way from a tavern to his dorm. He decided to walk the less than two miles home - got caught in a white-out and never made it. They found his body two months later with the spring thaw, he was within sight of his dorm. And no, he wasn't drunk.

>BTW I dont beleave I sayed anything about 5 watts. Seems how I'm the guy
>from
>Arkansas! You seem to think that APRS through out the country is the same
>as in
>Sioux Falls. Sorry but that is not the case. I would hope folks everywhere

>tolorate such activity but I don't think anyone anywhere would consider you
>courtious.

As I have pointed out many times, I've been in APRS longer than most and have operated APRS locally in both rural and urban situations, including driving cross-country. Don't tell me I seem to think APRS is the same everywhere. Unfortunately it is not. Unfortunately we have certain areas of the country where the LOCAL users have assumed that 144.39 is their private playground and they can't run local nets on any other frequency.

Again, the whole purpose of the 144.39 MHz frequency is to UNIFY operations for people travelling from town-to-town and state-to-state at the lowest common denominator. That is basic equipment: a rock-bound transmitter (not necessarily transceiver), a Tinytrak or similar, and a GPS engine. Again, Set and Forget for most successful operation in the majority of circumstances. When does your APRS setup quit working? When you futz with it a lot. When does that happen? Usually when you're 500 miles from home and don't have the time or tools to address the situation. The name APRS says it all. AUTOMATED Position Reporting System. It is not the Courtesy-Based Position Reporting System. The term courtesy assumes manual (human intervention) control. Someday we'll get to a point where there will be a low-cost box that can use some kind of AI for beacon rate, path, RF output, corner pinning, etc. - but we're not there yet. We still have plenty of people running blind or dumb trackers. I am one of them.

I don't ever want to hear anyone saying that a guy driving a wheeled ground vehicle (no airplane arguments, please) cross-country with basic equipment - beaconing at a rate of 1 to 3 minutes, running a path of relay, wide, and pumping out 50 watts is somehow being discourteous on 144.39 MHz APRS. If you guys want to set up a private APRS network with local customs and paths and beacon rates and power rating suggestions, fine. You guys know your local geographic and RF topography, but don't put that onus on passers-through and don't do it on 144.39 MHz. Obviously if you know you can hit your home-town repeater with 5 watts doing 90% of your day-to-day driving and you seldom get up over 30 MPH in stop and go traffic and a beacon rate of 5 minutes or more is fine, than go ahead with those settings. Please don't put those same expectations on a guy from two states over passing by on the Interstate.

301. [aprssig] DIGI_NED 0.3.3 update

From: Henk de Groot <henk.de.groot@hetnet.nl>
Date: Sat, 14 Dec 2002 11:40:53 +0100
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-110997-2002.12.14-05.28.15--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello,

Here is a small update to DIGI_NED, version 0.3.3.

A problem was found in the "diginext:" rule, which shows once again that late changes are a bad idea... Anyway, I fixed it. If you plan to use this "diginext:" rule then fetch a new copy from the web. Otherwise you can just continue with the previous 0.3.3, it also works okay except for this "diginext:" rule. There are no functional differences.

I didn't update the version number as it is only a small correction, the change is however described in the change log.

As usual the this version and the source are available on the web via:

http://www.qsl.net/digi_ned

or

http://www.homepages.hetnet.nl/~remko

Here are the changes from the Changes.txt file:

Changes.txt

14-12-2002 version 0.3.3 + correction
- Boris, OK1RQ found a problem with the new "diginext:" rule, it also
   executed the "digifirst:" rules due to a bug.

APRS[tm] is a Trademark of Bob Bruninga,
his home page is at "http://web.usna.navy.mil/~bruninga/aprs.html"

Kind regards,

Henk.

Now I know why I hear these police chases every so often on IH-35... If my arithmetic is correct 16 to 17 miles in ten minutes translates to 96 to 102 miles per hour... I will have to watch my display a little closer to see you whizzing past... What call sign should I look for? Got to be the fastest 18-wheeler on the road...

(Belton is 60 miles north of Austin, 130 miles south of Dallas on IH-35, along his route.)

BTW, when you pick up a digi between Salado and Belton, it is my weather station, W5VEX-1, transmitting data from a Peet unit. I understand that the D700 cannot display the data from the Peet units or I would have bought one. You can check my data out by going to;

http://www.findu.com/cgi-bin/wxpage.cgi?call=w5vex-1&radar=ewx&last=120

If I see you flying up 35, I might get the locals to set up a roadblock and buy you a cup of coffee...

Also, I have traveled the country extensively with a transmission every minute with a 5-5, usually gives me a good track. When I hit a metropolitan area I back down the rate to about every 4 or 5 minutes... I will be going to Houston today if you want to see the track...

Joe Dorn, W5VEX, Belton, Texas

Ouch... 10 minutes? That's more like 16-17 miles to me. Especially when I'm making midnight runs (like Dallas-Austin), I'll run a 60 sec beacon rate with a WIDE5-5 path from a D700 using a ~5dbi gain antenna. Considering most of the packets transmitted at night are fixed stations broadcasting weather data (the digis that ID every 3 minutes or so and don't broadcast any weather data are another topic for discussion one of these days), it doesn't bother anyone, and it's nice to be able to make it in to both cities via RF.

Here is what I do:
I use a TTII with smart beaconing. I have one setting with smart beaconing on and one with it off set to beacon every minute. With smart beaconing on I can use a path that will get me to FINDU most of the time without QRMing the channel while my car/boat/plane is sitting still. If I really need to get found and I was stuck I can just switch to once per minute.

This discussion group has raised the issue of SSTV via repeaters but:

Have any tests been done to determine how well "1200 baud Standard VHF Packet" goes through repeaters? Then the extension to that is how well it would work when repeaters are linked using IRLP? Al

What about a business rate cable modem? The cable company for my city offers residential and business rates. Residential for $34.95 with existing cable service or $44.95 without. Residential gets a dynamic IP. Business is $69.95 with $250 setup but includes a static ip. I think they're saying 3 Mbps down and 256Kbps up.

Perhaps your area has something similar. The problem will likely be your uplink bandwidth.

Ryan K9ZOE

> They do not serve my exchange (though they will give me a T1 for
> $750/month), nor does Earthlink provide fixed IP on my exchange.

Actually you may not be all that far off. here in AZ the speed limit is 75mph so to see people doing 80-85 is not uncommon at all.

The issue I have is that I do not own a laptop so I will have to set and forget. Some people have wanted to send me MSG's on APRS but due to the fact that I wont have the capability that is out. I have tried to con my brother to lend me his but I was given the one finger salute..LOL

If there is anyone that wants to fed ex one to me before Thursday I will guarantee its return by the second week of Jan...you know Christmas is coming...hint hint...:}

As far as the stopping debate, in the box I have mounted all the equipment in there is a relay that is triggered by the ignition, not the ACC but actual "run" position of the circuit. So when the car is off the equipment is off, this settles the issue with stopping at a rest stop or anywhere else and helps the wife not wanting to reach in and turning it on and off all the time.

Two things I have learned being married....
1. Keep it simple
2. say "yes dear" allot!

As far as the settings go, relay,wide,wide and a 3 min reporting rate should cover the ride just fine. Believe it or not, I would love to set it to 15 to 20 seconds for town use but that would flood way to easy, this is a big town and our street speed limits are 50mph, in 1 min that's allot of ground covered especially when you are looking at street level maps.

Hey I got a great idea! Ill set it up to do 10 second reporting and run 1500 watts until the alternator explodes!...LOL ok just kidding!

As far as general packet radio, here in town we have the 145.11 machine that is dedicated to packet only, it can run 1200 and 9600 without a hitch. With IRLP I would think you would have to setup a delay between the keyup and the transmission due to the slight lag in the link.

As far as SSTV goes, we have been running it on The AATV 145.19 repeater for years, I just use the soundcard with a double ended plug directly from the radio to the mic input with no modification at all. Output is direct from the card to the mic plug, I do have to manually key it but that was because I was just lazy and didn't feel like wiring it.

I can't offer a site, but I do recall a former co-worker having great success at www.dyndns.com with providing him a method of hosting a server on his Verizon dynamic IP DSL account at home. I had looked at www.tzo.com too but have no experience with them.

A dynamic IP shouldn't be a road block for hosting a server.

While on the subject of DirectTv DSL....

I found myself living in the 19th Century part of Ohio (well, if you look on the map, I am between Cincinnati and Middletown), but we are "served" by Adelphia Communications.

As a result, I cannot get TimeWarner Roadrunner, I am too far out from the nearest Cincinnati Bell ESS for xDSL, CBT has no plans to upgrade the SLK banks for data beyond 9K6, and Adelphia is --- well, Adelphia.

I need something faster than dialup!

Does anyone have first hand info on Dish or Direct products? I understand that Dish will give me a static IP and that Direct cannot be used for real time/ streaming audio or video.

Suggestions?

I need to join the 21st Century...

I have built multiple trackers based on MFJ DataRadios, KPC3 TNCs and Holux GPS receivers. Not a display in the lot. If you can tell me what to look at to pull coordinates from in that combination, please do.

>BTW I dont beleave I sayed anything about 5 watts.

No, I'm the one who said "5 watts". It was in relation to an APRS digi that you claimed could be reliably hit from 50 miles (or perhaps 25 miles either side; it wasn't clear from your context). I questioned that claim, and I still question it. I described a tracker that I built, with the implication that your "50 mile" range digi would have more than a little trouble with this tracker.

>Seems how I'm the guy from

>courtious.

It's an interesting definition of "courtesy" wherein the temporary visitor, operating on what is supposedly a national standard, is barely tolerated.

I am running starband at the moment, havve been for the last 12 months or so. Have had no major problems with it, albeit they are in chapter 11 at the moment since late summer but the service is actually better now than before filing. Not sure if they are taking new customers though. There are some issues, but I have seen nothing of the problems that the vocal minority seems to complain about with starband. We do have a wireless company providing service that I may be in range of though so may be switching just to give my support to a local company.

Though having an internet connection that isnt dependent on the condition of the local backbone is nice. course if somebody cuts a cable in georgia I am off line :)

I have used realplayer with starband successfully most of the time, but have never tried real time voice to voice. My wife has and believe it worked but there were the characteric satellite lag times.

Rendered body type: text/plain

Stephen, you wrote:

>MixW (the multimode sound card program) can emulate a multi-mode TNC like
>a KAM or PK232. Set to the "1200 baud Standard VHF Packet" mode, it does
>an absolutely superb job as a TNC -- it outperfoms EVERY TNC hardware or
>software TNC that I have ever tested.

I'm not doubting you, but what criteria were you using to say MixW
outperforms AGWPE (a software TNC)? That it's more tolerant of   various
sound cards (as you say below) or were implying it does a better job of
hearing and decoding?

Is it also not true that MixW requires a $50 registration fee? AGWPE is
free. It could well be that MixW is better for some users, but if you can
make AGWPE work, you save $50.

It also sounds like you need 2 physical serials ports to make MixW work on
a Win9X system (your next paragraph). Yes? That seems like another downside
to MixW compared to AGWPE

And MixW is not TCP/IP network compatible. Yes? Might be important for
those who want to have more than one program connect to the modem or for
those that want to have one program connect to more than one radio/modem.

I haven't worked with MixW, so I'm just trying to illicit some of the
pluses and minuses of each program.

315. [aprssig] Satellite internet, was Direct TV DSL SK

From: Jeff King <jeff@aerodata.net>
Date: Sat, 14 Dec 2002 12:43:20 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>

Rendered body type: text/plain

Hello Bob:

I'm in the same boat as you, cows and trees and the closet cable product 5 miles away, the closet DSL product 20 miles away. A T1 would have cost me $900+ a month. So, I've been using DirecWay (directtv) since October (the Hughes product). So far, relatively pleased with it.

I was considering the "dish" product (StarBand) however when they went into chapter 11 I decided not to.

Plus, Hughes had a 99/99 plan, in which you could finance the equipment over a year, not that I needed it, but I figured it would lessen my exposure if they went the same way as Starband (which required you to purchase the modem up front... $400-$500).

Anyways, here are the problems with Direcway (and the reasons I was going to go with Starband).

No static or dynamic IP. In the residential class service, they NAT everyone to the 10.x.x.x subnet. This is not true however in the business class service, you get a exposed static IP address here. More on the business class later.

The notorious "FAP". The FAP, or Fair Access Policy, limits the amount of data you can download in a certain period of time. For residential service it is 169megabytes in a four hour period. In reality, I have only been hit with this a few times (it reduces your speed to about 100Kbps), once when streaming some high fi audio the whole day and the other time when downloading the WinCE development kit from MicroSoft (a 300 meg download). There are download plugins for some of the browsers in which you can limit download speed, so for downloads the fap is a non-issue. If you heavy into real audio/video, then the business class service might be better, it gives a FAP of 500 megabytes per 4 hour period. However, yet to have a problem with any of the talk radio streaming audio sites (which I have running almost non-stop when I am down here).

Uploads. Both Direcway and Starband are asymmetrical, meaning upload speed is less then download. In this case alot. Expect upload speeds of 20kbps-70kbps on both products. You could run a small server with this, but never a major one.

Latency. You have to go up and back from a satellite 22,000 miles away. Add ~300-500ms to the ping times you get with standard landline internet. Not good for gamers.

Now, the good things about Direcway (besides the fact it is the only game in town for folks like us!)

Speed. They promise 400kbps. It is a rare time I am ever below this. It averages around 1Mbps for me. I have had peak sustained speeds of 1.8Mbps, and I hear other folks are getting even higher. I understand even in the good times, they had Starband beat hands down here.

Cost. They are cheaper then Starband. $59 a month compared to $69 a month.

A few comments about business class service. The cost here is $89 a month and for that you get a static IP, more sockets/streams allocated to you and the FAP increased to 500megabytes. I had planned on going to the right away but so far the residential service has worked out. Still will likely do it before the spring, but mostly for the static IP.

My current setup is Windows 2000 as the server and what the Direcway is installed on. From there, I use ICS to share the connection via 802.11b as well as ethernet to 3 more windows boxes, two laptops and a couple Linux boxes. Have had 3 people on the system using the internet with no apparent degradation (unless one is downloading a large file of course).

There are some new products on the horizon (like Wild Blue) but the whole industry is in turmoil at the moment because of the echostar <> hughes merger being shot down. I guess the only good news here is Hughes did go on record yesterday that Direcway would be with us for some time to come and the comments made in the WSJ where not its plans.

Good luck and let me know if you get the product, I can help you set things up.

>
It is a road block for use as a name server, which is an important part of what
I do with aprs.net. Also, using dynamic dns adds another delay in the
access...for example when you access www3.findu.com, you first resolve
www3.findu.com with my name server, and you get the dyndns name k4hg.homeip.net,
then you have to go to dydns to find the IP. Finally, when the IP address
changes, it takes time for the old name to flush out of the pipe. You can set
the TTL short, but not all DNS caches obey this.

```
Morning all,
I had set my tracker to one minute intervals for the tracker in the car to
be able to give a somewhat real time tracking capability for my wife driving
back and forth between states taking care of her grandmother. That way I
could track from the house where I work. I did include my email address for
an acknowlagement if a message was sent to to the unit so there was a way to
communicate with me for any probems. Most of the hams that sent a email said
the same thing, one minute intervals was to short an interval, change it.
How many feet per second can you cover at 75MPH and how much does your
position change at that speed? Tracking intervals for MOVING objects should
be set small to be able to track objects. I noticed that the intrval for
balloons that have the interval that are set that low are not complained
about. Mark is right about the tracking on the aprs network. Good example is
the couple that ran off the road in Coloado, they froze to death being 50
```

feet from the road and 30 feet from a farmhouse in whiteout conditions. I live in cheyenne and the snow NEVER falls straight down, it comes in sideways from the wind up here that is a the verry least a five MPH constant. If the WHOLE community could figgure out what the position report rates SHOULD be for the whole country then it might be a better place.

Just my opinion on the matter.

Well, the digis PI1APA and PI1APK have only a very simple binary interface, so the VSWR is only "good" or "too high". With the telemetry interface you can have analog inputs (or someone can make it themselfs, the interface to the LPT port is extreemly simple). You can fill in the equations; nice thing is that DIGI_NED also not only sends the equations but also uses these itself! You can ask the digi for the value of a telemetry signal with query "?tlm A1". As response the digi gives the value of the A1 (first analog) input, for example "Battery 12.5 volt". The label "Battery", unit "volt" and the equation to scale the input to "12.5" are all read from the same beacon data as is transmitted on air. DK5JG used the equations in his termometer experiment.

>Also, these two told me that they specifically set the path on these
>packets so
>that they would not reach the APRS IS, as they felt this was internal
>information, and did not wish it shared. Indeed, for both of these stations in

Oh, that has nothing to do with not wanting to get to the IS an share it, more like what load on the APRS QRG is acceptable for telemetry. This telemetry is funny with these messages that a station sends to itself to inform other stations about coefficients, labels, units and bits. When it would be send with the same paths as beacons we would get a lot of complaints about why we transmit something that looks like junk to an uninformed person. So we restrict it such that is reaches the people locally who actually use it and who are close enough to be able to explain what it is.

As you said, what is the meaning, even with the labels and units. So we just don't want to litter the QRG with this. Unfortunately there is no near-by IS gate so most of the time the telemetry will not reach it.

When there would be more clients which support telemetry according to the APRS Spec then it may be worthwile to expand the path to a bigger audience. Currently I think only APRSDOS and maybe UIview with a propper plugin support it. I monitor the telemetry in a telnet screen that runs 'listen' and a simple AWK program. Xastir would be a nice candidate to add propper telemetry support.

We have some crazy hardware ideas too. For example make a led bar for displaying the binary values and analog meters to show the analog values so you have all the measurements of the digi right in front of you in the shack, using normal meters and status leds.

Once we used one of the analog values as visit counter at a Ham fair, so you could see realtime how many visitors passed and with a demonstration TH-D7 we could send "?tlm A1" and get the response "PWGN 138 visitors" for example. You could also see the number of visitors in the last hour.

Unfortunatly the visitor detector didn't work (light with mirror and
detector), the pathway was too wide and the detector did not receive enough
light to give pluses to count.

Anyway, fun stuff with 1001 applications. Today with the DOS version you
can start QBASIC programs and have its output transmitted (and with Linux
you can start executables, but for Linux much more is possible anyway). We
have an active ham who is experimenting with automatic RDF measurements.
But you can also use it for the propriatry 16 bit telemetry format.

Kind regards,

Henk.

Check out easydns   http://easydns.com

They can manage your domain and support dynamic dns for about $50 a year/per
domain.

I have my dad's computer set up to dynamic dns to my domain so I can remotely
access it to fix problems.

I had my web server set up to do the same.

As for connectivity for people in rural area's, check out Sprint's PCS Vision
Service. If you are in there coverage area you can get a 56K - 144K
connection.

I have too co-workers who testing this out right now.

They have an unlimited data plan at $99 month using a PCMCIA PCS radio card.

You can also make it work with a higher tier PCS phone using a USB cable.

(It looks like it can cost a lot less, although there is some controversy over
whether Sprint will actually allow you to this).

(No good for findu of course).

Hopefully, DirectDSL will find some one to take over the service for you.

Hola:

Te invitamos a conocer nuestras terapias , y si no te gusta nuestro servicio NO PAGAS!! Promoci�n valida todo el mes de Diciembre.
Al Sur.
Centro Relax
Av. Patriotismo 888-b
Col. Insurgentes Mixcoac
Tel. 8500-5000

Al Poniente
Bosques Massage
Av. Stim No. 101 Interior 2
Col. Lomas del Chamizal
Tel. 8595-5886
http://www.centrorelax.com.mx
Servicios:
Masaje Antiestr�s Ejecutivo
Se realiza por todo el cuerpo. Es un tratamiento suave que se realiza con el paciente desnudo o en ropa interior c�moda y que ayuda a descargar todas las tensiones acumuladas. Es un masaje que se puede realizar en cualquier momento y que resulta muy agradable para quien lo recibe.
Precio Normal $ 375.00
Promoci�n $ 250.00

Masaje Reductivo
Es un masaje reductivo donde se trabajan las zonas con mayor cantidad de grasa, produciendo calor con movimientos especiales que ayudan a disolver las grasas.
Precio Normal $ 2,200.00
Promoci�n $ 1,500.00
Consta de seis sesiones

Masaje Anticelulitis
Se trata de un tipo de masaje totalmente atraum�tico, particularmente indicado en el tratamiento de la celulitis, donde ofrece excelente resultados. Su finalidad b�sica es ayudar en el retorno de la linfa, facilitando de esta forma los efectos y funciones del sistema linf�tico.
Precio Normal $ 3,800.00
Promoci�n $ 2,500.00
Consta de diez sesiones y se recomienda tomarlas en un m�ximo de 25 d�as.

Masaje a cuatro manos
Los masajes a cuatro manos le hacen sentirse a uno estupendamente, suponen un b�lsamo para la piel y aportan un relax total.
Precio Normal $ 750.00
Promoci�n $ 500.00

Masaje para parejas.
El cual tomaras en un cub�culo doble en donde t� y tu pareja disfrutaran de un magnifico masaje relax sin perderse de vista el uno del otro, comparte con esa persona especial este momento inolvidable.
Precio Normal $ 750.00
Promoci�n $ 500.00

Estamos a tus �rdenes de Lunes a S�bado de 10 a 21 horas.

323. [aprssig] UI-VIEW TActical Display

From: "Andrew Rich" <andrew.rich@bigpond.com>
Date: Sun, 15 Dec 2002 18:03:25 +1000
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: "Peter and Heather" <heathernpeter@dnet.aunz.com>
Message-ID: <LYR842-111121-2002.12.15-02.49.02--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I was at a mesuem the other day and saw a radar tactical display.

I thought to myself there is no reason why UI-VIEW could not look the same.

I turned my map to black, and set the symbols to something compatible.

I came up with this :-
[Attachment: tact.JPG; image/jpeg; 4,934 bytes]

324. [aprssig] Re: Direct TV DSL SK

From: "Matthew C. Payne" <kb9uje@qsl.net>

Rendered body type: text/plain

This is true. DynDNS has been fairly reliable. I have used it for a couple of years, and I know others who have also. I have never witnessed any problems with the service.

Steve, what is the lease time on the Earthlink IP addresses? I know someone who has had a cable modem for over a year with a service that offers only dynamic IP addresses. His IP has never changed, becuase his computer has never been powered down for more than the time that the lease specified.

Not having a static IP may not be an issue for you.

Matt

326. [aprssig] APRS weather station question

From: "K4MQF" <k4mqf@direcway.com>
Date: Sun, 15 Dec 2002 11:53:22 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-111173-2002.12.15-11.38.38--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I am looking at a weather station for home and yes I am pinching pennies
like anyone else.
I am looking at the Lacrosse WS2310 station
complete with software and all sensors. Has anyone tried to interface one to
a KPC3 TNC for a weather APRS system ?

Mike K4MQF

Mike,

With the Lacrosse WS2310 weather station and the Weather-Display software
described here

http://www.weather-display.com/

you can send weather data to APRSWXNET/Citizen Weather Observer Program via
the internet. See link below.

```
Anybody remember the name of the manufacturer of the N+1 power
supplies that Radio Shack was selling about a year ago? Couldn't find
any info on their site, or in the manuals download section.

Also, if you have or had one of these, any pros/cons or other
experience would be appreciated.

You can send to me off list if you think this is too far off-topic,
but it is for a remote APRS digi installation.

As I said, it is an issue, because you cannot run a name server on a dynamic IP,
and because of name server cache flushing. I do not know about earthlink, but my
bellsouth dsl in the Keys rarely goes 3 days without an IP change, and sometimes
goes through several in a day.

I wasn't even aware Radio Shack sold N+1 power supplies...

I know their current (pardon the pun) crop of 12 volt power supplies bear a
striking resemblence to Samlex.  But I don't think they make a computer (?)
power supply.

I don't think you understand. I manage my own domains (10 of them), providing
service to many people on aprs.net and other domains. I do not want or need a
commercial service to do this. You CANNOT run a nameserver on a dynamic IP.
>
>I have my dad's computer set up to dynamic dns to my domain so I can remotely

>
>I had my web server set up to do the same.
>
I'm very familiar with dyanamic DNS, 4 years ago I wrote the Mac client for
dynip.com, and I currently use dyndns.org to have my Keys server respond to
keys.findu.com and www3.findu.com. If this were reliable enough, that would be
the backup findU server. However, my testing shows that it is not. There is a
difference between using dynamic dns for a rarely used web server and one that
generates 100,000 page-views a day. Every time the IP changes, it takes 30
minutes to 24 hours for the name server caches to clear (some servers ignore the
TTL specified by the  name record, and simply set their own, up to 24 hours).
This is not acceptable for findu.

How bad this is will become clear to people if my DSL connection dies before Guy
gets off his butt and gets the new server running, the Keys box will be the only
findU machine up until I get the old box moved. On that count, let me mention
that I've had many generous offers, and do not need any more, thanks to all. If
findU does go down, it will be a temporary thing, only lasting a couple of days
while I fedex the machine to its new home.

Less than T1 (after all it lives now on 256k uplink on the DSL, but it
definitely makes it hard to use the DSL line for other purposes, often the
uplink is significantly slowed). It would use enough of a T1 to affect other
use, much less liekly to cause problems if on a fatter pipe. I've already got
enough offers from well connected sites, thanks!

Yes, I understand what you are doing. I administer 2 DNS servers (1 internal and 1 external) at work and I chose to use easyDNS at home for precisely that reason. My DSL service provides dynamic IP's, although the address only seems to change if I change the MAC address of my ethernet interface (say swapping routers, or temporarily connecting my system directly to the internet to debug a problem).

Okay, you've got me there. That sucks (overriding the TTL, although I can see the reasons why someone might do that).

Good to hear.

What are the problems Guy is having getting the new box setup ?
Has he asked for help ?

Last posting on the subject more than a month ago, November 3. They simply do not have time, I sent them all the pieces and the instructions to get the parser running. An offer to do the configuration a few weeks ago I forwarded to them from a ham with excellent experience, APRS credibility and the time to make it happen quickly went unanswered, as have a couple messages since the news on Friday.

Given the time pressure, I have asked that if they do not have the time to get it going this week, they either release the machine to someone that can make it happen, or provide me with the passwords so I can configure the machine. Not a peep so far...

Mark,

I am getting ready to do just that but with the WS2310 lacrosse model. I'll
keep you informaed as to how it goes. I choose the WS2310 since it had the
rs232 port and it was 239 with free shipping :) when I got it.

>  hearing and decoding?

I have compared the programs by running the two in two computers side by side
decoding the same audio from the same receiver at the same time.   Mix
consistantly decodes many (weak, not fully quieted or distorted) packets that
AGW won't touch.   It's also much less fussy about audio input level to the
sound card.

>  Is it also not true that MixW requires a $50 registration fee? AGWPE is
>  free. It could well be that MixW is better for some users, but if you can
>  make AGWPE work, you save $50.

Yes, Mix is shareware but it is a complete program that operates practically
EVERY mode possibile on a sound card (PSK31, RTTY, CW, SSTV, MT63  and other
many new digital modes, etc) , provides frequency control for CAT-compatible
radios (you can tune the transceiver with the scroll wheel on a wheel mouse),
has an internal logging system, generates great circle world maps centered on
your QTH showing beam heading when you enter the call of a station to answer,
functions as either a keyboard-based CW keyer or can handle a paddle
connected to the game port, .    It is far more than just a sound card
"driver" for packet like AGW.
     On HF packet, the waterfall display makes it infinitely easier to tune
in brief packet bursts (you can click on the trail on the waterfall display
AFTER a packet burst is finished and be ready for the next one) compared to
the trial and error tuning of the radio required by AGW or a hardware TNC
with fixed tone freqs.
```

downside
> to MixW compared to AGWPE

True.. There are rumors that the MixW team is working on a virtual comport
bridge similar to the one for Win 2K.

> And MixW is not TCP/IP network compatible. Yes?

It has some sort of TCP/IP I/O function but I haven't played with it yet.

I can confirm Steve's findings. I have done the same kind of test with the same kind of results. MixW32 is more resistant to noise and multipath. I compared it to:

PacComm Tiny2
PacComm Pico
PK-232 MBX
DSP 2232 (AEA)
MFJ-1270 with DCD mod

I fed the same audio into the MixW32 sound card and the tncs (one at a time, of course), after optimizing the audio level to the TNC's for best decoding.

I then kept track of performance in the following way:

How many packets from ISS or PCsat did MixW32 display that were not
displayed by the hardware tncs?
Quite a few.

How many packets from ISS or PCsat did the hardware tnc's display that
MixW32 did not?
Hardly any.

Seems like a fair test to me. And...no I didn't do a statistical study, but the results were quite obvious.

Somehow the authors of MixW32 have succeeded in getting the sound card to out perform hardware tncs at 1200 baud, at least for the limited sample of ISS and PCsat.

As they say, "Your mileage may vary"...but Steve's and mine didn't. <grin>

....hasan, N0AN

PCsat is still fully functional even though it is in maximum eclipse
cycles, so it should support your Holiday Travels just fine thanks to
several command stations (WB4APR, G6LVB, W4EPI, VK2XGJ, ZL1AOX, ZR1CBC,
N6CO, ZR1FN and others making sure the 72 hour failsafe timer remains
toggled at least once every 3 days). Here are the pass periods for this
week for your mobile satellite operations...

```
Sats 06 07 08 09 10 11 12 13 14 15 16 17 18 19 20 21 22 23 00 01 02 03

Rendered body type: text/plain

1200 baud packet has been being done through repeaters dedicated to it here in the Seattle area for over 15 years. On "conventional" voice repeaters, the ability to be used may depend on use of sub-audible tone equipment, the delays of which will increase the TXDELAY your station needs to use to cause the repeater to recognize a signal it should pass. Also, some repeaters have squelch tail eliminators built in. These usually act by delaying the repeater audio, and switching that audio path off as soon as the digital signal from the squelch circuit detects that there is no longer a signal coming into the receiver. Since the audio circuit is disconnected before the squelch noise burst has propagated through the delay, the squelch tail is eliminated. This can easily affect packet, because most TNCs are configured to unkey the radio as soon as the last bits of the end-of-frame marker are transmitted. Unless the delay of the received audio very closely matches the delay of the squelch circuit, the last few bits of the packet will also still be in the audio delay at the point when the audio path switch is operated. On all the TNCs I've studied, this behavior can be altered by a setting known on some as

TXTail. This sets a timer in the TNC that determines how long to wait to unkey the transmitter after the last of the data is transmitted. This technique has been tested on a few repeaters in this area that have the audio delay circuitry I've described.

> clients?

Yes. I have used it with APRSplus, APRSpoint and UI-View. As I mentioned in the previous posts, MixW does a KISS TNC emulation; it can output received data to a serial port at the same time it is displaying packets on it's internal window. You then set up the APRS client to expect a KISS TNC on a second serial port either on the same or a different PC. Connect the two ports together with a cross-over (null-modem) serial cable.

If you are running Windows 2000 or XP, you don't need to use any serial ports at all!   An add-on component (the Mix Serial Port Bridge driver) simulates a pair of "virtual" serial ports cross-connected. You then set Mix to use one of the virtual ports and the APRS client (or any other packet using app such as a DX cluster, mailbox system, etc) to use the other virtual port. [This port emulator only works with 2K and XP. Rumor has it that the Mix developement team is working on a similar emulator for Win 9x.]

You WILL have to use true 32-bit Windows apps since the older 16-bit ones normally can't access COM ports above the first 4. The Mix bridge is typically set to the higher order ports (mine is COM5 <--> COM6) to avoid conflicts with physical serial ports, modems, IR devices, etc that are already in the machine.

People

Has anyone determined how to get the GPS packets that are being sent out from a Garmin RINO?

I'm shopping for a new laptop computer, but most of the new laptops come without RS232 ports. Has anyone tried one of the USB to RS232 converters on a TNC? GPS? Wx station? Win95? Win98? WinXP? APRS programs? Terminal programs like Procomm? Do they work? How do you setup the program? For example in WinAPRS what serial port would you tell the program your TNC was on? It only says Com1 Com2 . . .
How doed the whimpy looking USB connector hold up? What about programs like programming software for D7?

Ant recommendations for a laptop that does have RS232?

> K9SA

OK, first off, it's NOT an issue with the USB<->Serial converters.
Well, mostly. It's SOFTWARE.

If you SOFTWARE can handle the fact that the serial port that
a USB adapter puts out there, then it should work. if it can't,
then it won't.

I just, last night, needed another serial port for my IBM Thinkpad,
so I ran to RS and picked up the USB converter cable there.
Plugged it in, and it didn't work. Why? Cause the SOFTWARE
wasn't configured for COM5. Put support for a com port number
than high in my program and it worked just fine.

Yes, there may be issues with some of the early hardware, but
really that shouldn't be an issue today.

So, don't ask if the cables work, they do. Ask if the software you
want to USE with them will work.

Now, there is a caveat... USB to Serial cables work by creating a
VIRTUAL serial port. To do that, the machine has to be in
'protected' mode. You're not going to find that (mostly) on DOS
machines. There are a few machines that have the USB support in
the BIOS, but even then, it is rare for the BIOS to support more
than keyboard or mouse on the USB.

Rendered body type: text/plain

Hi,

I recently picked up a collection of sub-D connectors that I would like
to give away as I really don't use them, and they're just laying around
cluttering my shack. All of them have been used in a professional
environment as jumpers, and they all have black AMP housing with them
(with the exeption of the jumper boxes, which are off-white).

I have:
25 pins female x 1
25 pins male x 7
9 pins female x 2
9 pins male x 37
jumperbox (25 pins female - 25 pins male) x 2

Any contribution to the shipping costs would be appreciated, but for the
rest... please let me know if you can use them, and you can have them
for free.

>Ant recommendations for a laptop that does have RS232?

HP ZE4145 I have linux and Windows XP installed on mine.  If you want to dual
boot this machine, it takes some careful partition table changes, write me for
the details.

Athelon 1.8, 512mb RAM, 40GB disk, CDRW/DVD.  Built in ethernet, modem, two
USB slots, S-video out, parallel port and serial port.  Two PCMCIA slots,
audio controls with earphone and mic jack on side for easy EchoLink use.

I've used the serial port into my THD7-A with no problems.

I got this one for $1299.00 during a rebate sale in Oct at Best Buy.  They are
currently between $1249.00 and $1599.00 according to BizRate.com.

Assuming you are wanting to extract posits.

When I spoke to my OEM contact at Garmin a few months ago, they where
unwilling to release this protocol. Maybe that has changed now, but they
seemed to think I could do what I want by polling the unit for waypoints of
other reporting RINO's.

I understand their is a active RINO user group on yahoogroups, might check
there maybe?

I can see making the TTL shorter, and therefore keeping the DNS cache
fresher, but making it longer? That seems like something that would happen
on a low-speed connection to some backwater ISP.

I use no-ip.com for my dynamic DNS, and it usually takes 5-30 minutes to
refresh my DNS entry. This is fine since I'm not hosting a major page like
Findu.com, but it's still a PITA when the PPPoE DSL connection burps.

I have been using a laptop computer for about a year for controlling
radio's and connecting to a KPC-3 for APRS. The computer is running
Windows XP.

It didn't start out well but things are great now.

At first I was using a Belkin USB to Serial adapter and the driver

for it was the problem. Trying to connect to things like my IC-PCR1000
which has a high data rate would crash the computer. Belkin was not
interested
in trying to fix their driver.

Then I found Larry's USB to Serial Converted
(http://pfranc.com/usb/usb.shtml)
and with this converter I have had no problems. It works well with the
IC-PCR1000 which is the biggest test. I also use it with a number of Garmin
GPS's to program them and as part of a tracker. I have been able
to program my D7 and my D700. So it can be done.

There are some software programs around that will no work but most seem to
do
well. I have used WinAprs and APRS+.

I haven't had any problems with the connectors, but would not want to start
yanking on them. For normal use and some bouncing around in my truck they
hold
up fine.

Can someone guide me through the proper method to send an APRS message to
the ISS team. What do I use for a path? What frequency do I use (the
national APRS freq or the satallite uplink freq). How often should I beacon
the message?

Next question. What is the proper path and procedure for sending APRS
position data to be digipeated back down to earth?

I don't want to try it before I know exactly what to do and screw someone
else up. I need the information in as simple and plain English as possible.

G'Day

One of the things that has come up at the TAPR board is the need for some type of USB interface for HAM projects.

Until someone gets arround to actually building a kit for us hams to use, commercial solutions might be the way to go. One of the ideas that was brought up was that maybe that the USB-Serial cable from pFranc.com might be worth looking at.

For those that are not aware, pfranc.com is the home of the worlds first Shareware Hardware project for GARMIN GPS connectors... They also are selling a USB-RS232 cable. The advantage with this one is that they always have the same model.

So... Here is a challenge. Can someone buy one of these cables, and evaluate it please? And then write something up for here, and for the PSR magazine. And by writing it up and getting it published in PSR, you will get your TAPR membership extended by three months :-)

> Can someone guide me through the proper method to send an APRS message to
> the ISS team.

There is no method for getting messages to the astronauts on board the ISS.
The Personal Message System (PMS) is not recommended to be used, and the
messages stored on it are not read by the crew.

>What do I use for a path? What frequency do I use (the
> national APRS freq or the satallite uplink freq). How often should I
beacon
> the message?

This web page should answer your questions:
http://web.usna.navy.mil/~bruninga/iss-faq.html

> Next question. What is the proper path and procedure for sending APRS
> position data to be digipeated back down to earth?

(See above web page. Follow instructions carefully. Read thoroughly.)

> I don't want to try it before I know exactly what to do and screw someone
> else up. I need the information in as simple and plain English as
possible.

Very wise, as there are already enough people attempting to digipeat through
the ISS and access the PMS that don't know what they are doing. It all
results in QRM and prevents others from using the system. The procedures are
simple, but you do have to take the time to learn to use it the right way.

73 & good luck.

Skip,

IMHO, I had the same concerns as you. However, after experimenting a bit, I determined that if your software can handle simulated COM ports (more specifically COM 5), then it should work. I have tried several ham radio programs using a UBS -> Serial converter and those that exhibited problems were the older applications.

By that time, I had pretty much decided that if my "circa 1995" application cannot work with the new technology, then so be it... and bye-bye to the old software. It was either that, or remain in the "middle ages" of computing ;-)

I have ran tests with Windows XP Home SP1 and Windows XP Pro SP1, which I prefer over the Win9x series, and even over Windows 2000. By the way, a few of the strong points of the XP line are: Stability (especially with 32-bit applications), compatibility (much more than Win2k) and flexibility (you can tell your application to run as an XP app or as a Win 98/Win95 app... something you cannot do with Win2k).

I have tried the following: UI-View32, MixW 2.x, MMSSTV, DXPSK v1.7c, Stream, eQSO, EchoLINK, Hyperterminal 6x, SR5, and several commercial applications.

So it boils down to what extent you want to keep your old software (pretty much forget DOS applications with XP). Newer laptops are being built without the physical COM/LPT ports so, it's just a matter of time before they disappear completely.

By the way, I am not saying that Windows XP is a panacea. It sure has its own set of quirks, but it is stable and flexible.

How long before the big 3 put USB interfaces in the radios (or even the big 2 or 3 in the world of TNC's), as opposed to RS-232, which, while easy to homebrew for, is becoming antequated? (Nuts and Volts magazine ran an article some time ago about putting USB support in "your next project")

Just something to think about.

APRS programs? Terminal programs like Procomm? Do they work? How do you setup the program? For example in WinAPRS what serial port would you tell the program your TNC was on? It only says Com1 Com2 . . . How doed the whimpy looking USB connector hold up? What about programs like programming software for D7?

Not until users quit expecting dated DOS-based and 16-bit Win 3.x ham
software to work!   USB ports simply don't exist at DOS, or with Win 3.x --
the USB ports are totally dependent on drivers that are part of Win98 and
later  (Win 2K, XP, etc), and Linux.

The main problem with the serial <--> USB converter cables available is that
the virtual COM port created by the Windows drivers for these devices is
usually COM5 or higher (to avoid conflicts with exisiting physical COM ports,
built-in modems and IR devices which frequently claim the low-order ports
COM1 through COM4).

Most older (DOS and pre-Win9x) programs don't recognize or offer the choice
of com ports above COM4 (and a surprising number only offer COM1 or 2) in
their setup menus.

Any modern true 32-bit Windows app (i.e. native program for Win9x, 2K, XP,
etc) should be able to access high-order comports, virtual or real, with no
problems.

They have been discussed on this list a number of times.  The pfranc cable
works just fine, limited like any serial<--> USB cable, by the considerations
mentioned above.  I have actually used two of them at the same time to get
three com ports on one laptop quite successfully.
    One problem, reported by several users, is the assigned COM port number
changing randomly on successive boots of Windows, forcing you to change the
port assignments in applications each time.  I have not seen this behavior in
the pfranc cable myself.

Why do people keep getting back to the fallacy that this is something
special?

USB to serial works.  Now that is assuming that if you have a PROPER
USB to serial driver and hardware.

After that, it's the SOFTWARE ON THE COMPUTER issue!!  There's
not anything magical about one manufacturers cable over another.  IF
it is done right.  And yes, there were some toad standouts early in the
game.

But 99% or more of the time with new correct equipment it's a
software issue.

The same thing happened before, and will happen again, as technology.
With PC cards people learned that when a software writer takes
shortcuts, any change in the technology usually shows up fatal flaws
in the software.  But did they blame the authors who took shortcuts
in the software?  No, we had discussion after discussion on PC cards
being good or bad.  (Actually, there was some validity in this case, as
some PC cards weren't as 'generic' as they could have been.)  But
really, it's just a UART.  It's not good or bad!  It's the software that
talks to it.  And now it's again the software that talks to it.

Mike

Actually, it's not random. The problem is hot boot vs cold boot and
how devices are 'removed' prior to being detected again. There was
a very similar problem with PC cards that didn't 'reset' the controller
before restarting the POST. Devices left in the slots could be picked
up by the POST init routines and identified and assigned as if they
were permanent devices. Then the init routines would reset the
controller, and the 'card insert event' on initialization would treat the
card as a new insert and have to install it AFTER the stuff it thought
was already there. Then next boot it would see the card again but the
earlier phantom was gone.

The end result would be a card that would be toggling back and forth
between two addresses every time you 'hot' booted and left the card
inserted.

Unless the driver hooked the reset and killed the connection on reset.

But, you were still always at the mercy of a hardware reset switch that
didn't do a hardware kick of the PCMCIA controller....

Rendered body type: text/plain

I'm talking, but is the A2D used for the wind direction considered a
parasitic device or not? It has it's own power pin to the cap in the
unit, but there's no power detect command.

I suppose it would be safest if I issued the strong pullup, and then
just timed the conversion instead of checking for '1's or '0's on the
bus.

Which brings into question the sanity of the TAPR Board...or their technical knowledge... ;)

The problems with USB have been pointed out several times on this SIG.

A brief overview of these:

1) A poorly designed non-locking connector

2) A distance limitation of 4 to 5 meters per cable (and they mean it)

3) Not peer-to-peer - USB requires a high level host (although the next implementation of USB may fix that)

4) Nagging persistance issues (USB devices tend to dissapear without warning)

USB is a contruct of the WinTel duopoly to deal with retailer's (Best Buy, CompUSA, etc.) complaints about the high rate of returns on consumer grade computer peripherals like joysticks and scanners. It was never designed with anything else in mind.

If you look at how USB devices install and enumerate in your computer, you will find that all they do is emulate a legacy port, be it serial, parallel, or SCSI. If you got a USB TNC you would find that the issues you have with a USB to Serial converter would remain.

I actually own one of a handful of WinCE devices that supports USB host mode, a Casio E-200. We are just now getting a mouse driver for the darn thing - about a year late...

We have a better alternative - ETHERNET.

I'd love to spend more time on this issue, but I've got a plane to catch... Probably won't be able to respond to the SIG until next year...

Happy holidays and Merry Christmas,

Mark

I'm sure not all devices are the same however I have used some with 15
meters of cable.
If you use a hub you can extend range on most devices anyway.

.
? It was designed to allow expandability to Macs. The Mac was the first
to implement it. The indistry saw that computer only had limited
expandibility using comports.
You would be hard pressed to get more than 8 ports in a single computer.
The reason was
that each port required its own IRQ to work safely. USB removed that
restriction and allows
up to 27 devices per port.

ou look at how USB devices install and enumerate in your computer, you
> will find that all they do is emulate a legacy port, be it serial,

>

This is true if you add PS2 and IDE hehe If you think about it though Now
you
have one port that could do it all. I'm not saying USB is the greatest
here. I think
most of the problem come from the software side and not the port itself.
Give it time!

Rendered body type: text/plain

```
I have been given the passwords to the backup server, and the findU is up and
running on the backup machine.

I'm sure there are pieces I've overlooked, so I need everyone to try their
favorite URLs on the new server before it goes live.

To convert a URL, change www.findu.com to www2.findu.com, e.g. my weather page
is:

http://www2.findu.com/cgi-bin/wxpage.cgi?call=K4HG&last=24
```

There is only data since about 1AM eastern when I got the parser started, so things that use old data will not look the same, and the experimental telemetry stuff is not online. Everything else ought to be up and running, if not it is because of a missing library or Perl Module, so give this a good workout to ferret out what I've overlooked (there are about 70 separate pieces needed to make this work...).

I tried the link in the previous post:
http://www.kenwood.net/index.cfm?do=SupportFileCategory&FileCatID=3

and it worked perfectly. You may have something SERIOUSLY screwed up in your Internet connection or browser software ..

Did you try to download the file?  That doesn't work for me, either.  I'd
like this software, also.

>
>Which brings into question the sanity of the TAPR Board...or their
>technical knowledge... ;)

The issue here has to do with more than technical knowledge. It has to
do with the perceptions inside the Ham community. A large number of the
HAMs I talk to about TAPR ask about USB devices for Ham Radio. There is
at least a perceived demand in the ham marketplace for these devices.

Sometimes the right solution is not the best solution. For instance the
KISS protocol was published 12 years ago as a short term stop gap
measure. But it has endured despite problems. The same with USB.

USB has it's problems, and so does ethernet. Despite the work being done
recently with embedded controllers, Ethernet/TCPIP is not designed for
that type of environment. USB is. Ethernet is designed for fast
processors with lots of memory - particularly at higher speeds,
particularly running TCP/IP.

USB can be implemented on a high-end mid-range PIC with little more than
a differential transciever. Ethernet cannot - it requires a lot more
interface. So, for instance, we are looking at a US$10 PIC and a $2
transciever. For ethernet, you are looking at spending at least $50 for
the equivalent. Having said that, if a member came to the board and told
us they had an ethernet TNC and wanted TAPR to sell it as a Kit, I am
sure that we would look at it favourably.

So, my technical knowledge is not in question, although my sanity might
be (after agreeing to join the Tapr board :-)

Darryl

You could try the German site:

http://www.kenwood.de/download_com/tmd700.zip

I'm sure it is there. I hope it is in English though. I expect it is, I
downloaded the software for the TH-D7E from that site
<http://www.kenwood.de/download_com/Md7g110.zip> and at least that was in
English, so I suspect for the TM-D700 software it's the same.

Kind regards,

Henk.

Remember, you all paid for the hardware. Getting it up and running was a
volunteer effort, and as tends to happen, the volunteers were still trying to
find time to work on the project. Guy posted a couple updates on the situation
to the sig over the last couple months.

Getting this running took me the better part of the last two days, and I don't
have a learning curve to deal with. The code that underlies findU is really
pretty simple, the hard part is configuring all the software packages to play

together correctly.

>I KNOW IT WAS NOT YOU but thought this heading might get more reading and
>cause an update on status.   BEEN A LONG TIME....

Yes this is the server APRS users paid for, and yes, I was not to be involved other than providing my code and installation instructions. At the time I made it very clear that I did not want to handle the installation and maintenance myself for two reasons. First, monitoring a server takes a surprising amount of time, and I already had two to occupy my time. More important, I wanted someone else to understand how the pieces fit together so that should anything happen to my health or my interest in APRS, there would be someone that could keep it running.

However, because of the urgency in the present situation I got involved and did the installation myself. I'll continue to monitor this server, at least until the primary server is safely settled in at its new home in a data center.

So is TAPR going to develop such a device?

At some point TAPR expressed that TAPR wants to focus on providing enabling technology rather than developing finished products. I think that was just after cancellation of the SS radio project. To me this seems like an excellent opportunity. I'm sure TAPR must have done more at "board level" than merely recognizing this wish from the ham community. Everyone else already did this quite a while ago.

Perhaps TAPR could offer USB modems, like the one developed by Thomas, HB9JNX, and offered by the Bavarian Packet Radio Group. That would be a nice step forward.

73,

Since I'm no longer on the TAPR board (BTW, the sanity level thereby being
considerably raised) I have to say in the three years I did serve, no one
brought a single project proposal to TAPR with USB.

There still is this perception that TAPR has a technical staff they can assign
to any project they feel worthy. This simply is not the case...this is a
volunteer organization...and no one inside or outside TAPR had a plan to build a
USB device. TAPR can provide assistance to people that have a desire to create
something, but they cannot dictate projects to volunteers.

There is an important shortcoming of USB. It requires drivers for each platform.
Hams being a frugal bunch, there are many people still running Win 95 (or even
earlier), all the way through NT server. There are many people running Linux,
and more than a few using MacOS both OS 9 and earlier, and OS X. All of these
require separate drivers to be written, skills very different from those who
build hardware and write microcontroller programs. Writing these drivers is not
a trivial undertaking, and certainly not the sexy, highly visible project
talented voluteers tend to assign themselves to.

On the other hand, a serial port is a very well understood thing, built into
most microcontrollers, easy for a hardware builder to impelement. USB to serial
converters are cheap, and there are models with drivers for just about every
platform.

Check out

http://www.baycom.org/

They have a high speed USB modem ready now.

---------snip from website-------------

Modem availability

The USB Modem is available now. It costs 199.- DM / 102.- EURO.
For more infos on ordering/contact, please look here.
The modem is either available for 76k8 FSK or 9k6 FSK
(both versions can do 1200Bd AFSK by just setting the right configuration
parameters)
Baudrates can be altered to any value by changing seven 0805-SMD capacitors.
Upper limit for the modem is around 300kbit/s

Rendered body type: text/plain

```
I have a young friend who has decided to get into APRS, and asked me about
interfacing a Kenwood D700, a Delorme Earthmate, and a laptop computer for
mobile APRS.  Not being familiar with either the D700 or the Earthmate GPS,
I am hoping that somebody can steer me (and him) to a website that would
explain how to set this up, along with software recommendations.  Or any
other advice, for that matter.

Tnx & 73,
Mark Schneider  K5MAR

I suspect they would be a challenge to use for APRS position reporting, for a couple of reasons.

The main one is that the serial port on the unit doesn't talk standard 4800 baud NMEA. It's not anything like the normal GPS commands (and it's not the Motorola binary format either). In addition, I'm not sure, but I don't think you can set it to automatically output once per second. I think it only responds to a query command you send it. Additional problems are that the unit is designed to operate in fixed-position mode to improve timing accuracy, and I'm not sure it can be forced to stay in position fix mode (and if you kept it there, you'd lose frequency standard performance).

In short the Z3801A is a great frequency standard, but not a very good tracker!

"Ken Cechura" <kcechura@umr.edu> commented

>How long before the big 3 put USB interfaces in the radios (or even the
>big 2 or 3 in the world of TNC's), as opposed to RS-232, which, while

Funny you should mention that. The new ICOM D*STAR radio has USB for CONTROL. So things have started.

OK... For those that think this is a bloody stupid idea putting USB in this radio, I aggree for once. You see, data transfer is through ethernet, but the control is USB. You have to use both.

BTW, this is a ham radio, but it is not aimed at the ham market. It is aimed at the NGO (non-government organisations) who use ham radio as a communications means (read Red Cross and the like)...

Also in focus groups ICOM AMERICA got big kick for putting USB in...

The dedicated GPS port on the D700 will accept any STANDARD GPS device with a serial port outputting NMEA data (specifically the $GPRMC sentence) at 4800 or 9600 baud.

Unlike the earlier Delorme Tripmate, the Earthmate GPS DOES NOT output standard NMEA. It produces a proprietary binary format that is only usable by Delorme programs. By itself, it is completely useless for ham APRS applications.

For $50, you can buy a format converter device packaged in a gender-changer-like case that inserts between the Earthmate and other device such as a computer or ham tracker. If you are using the external power adapter for the Earthmate, this device bridges pin 9 of the DB9 (where the Earthmate receives it's external power) and will also power itself from the same source. See the website :
      http://www.byonics.com   (home of the TinyTrak tracker)

and click on the link for the GST-1 "GPS Sentence Translator" for more info.

From: Alex <kr1st@amsat.org>
>So is TAPR going to develop such a [USB] device?

I don't know. Basically it is up to the members.

>I'm sure TAPR must have done more at "board level" than
>merely recognizing this wish from the ham community.

I don't know. I have only been on the board for a few months. But in that time I started a personal TAPR to do list. That is up to 20 pages at the moment. Why only 20 pages... I havent had the chance to expand many of the headings.

In some cases projects are initiated by the board, some are initiated by the members. But we need people to work on these projects... We need for members to bring projects to the board... I have a good idea of the ham radio development going on here in Oz, but don't know much about the rest of the world. Many members know about their parts of the world, and know how TAPR can either assist or be assisted by local groups.

Please do not wait to be asked. If you have a skill that TAPR could use, please speak up. If you are an E-Commerce guru, we can use your help. If you are an expert on the internals of SourceForge we can use your assistance. If you design PCB's... Fantastic. Love microwave... I have a great idea for a simple microwave spectrum analyser... Just have time to read, well it would be great for someone to go through the old issues of PSR finding anthing that could be republished in the magazine next month. If all you can do is renew your membership, that would make me very happy. If you do embedded USB... I have a project for you too..

Without any more things on my list I could work full time on TAPR projects for the next few years and not finish. Ultimately TAPR is the organisation that the members make it. So if you have a skill we can use, please speak up.

Completely useless?

I have seen, but don't have any experience with the byonics device.

The linix gpsd package (http://freshmeat.net/projects/gpsd/?topic_id=20) understands earthmate (which is really rockwell binary) format, and will translate and output to nmea. I had this working with the earthmate and my d700 before I decided it was easier - not to mention more power consumption friendly - to just buy a cheap nmea gps. I ended up using the earthmate as a gps time clock to set my time server at the home qth.

But, if you don't have the luxury of replacing it, you can use a linux laptop to translate it. And, you can use gpsdrive (http://www.kraftvoll.at/software/index.shtml) as mapping software...

Or not..

396. [aprssig] Ethernet vs USB

From: "James Lux" <aprssig@luxfamily.com>
Date: Thu, 19 Dec 2002 1:14:26
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-111634-2002.12.19-01.59.59--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'd say that Ethernet is a much better choice. It IS supported by a wider variety of computers (including those old DOS boxes), and is well supported by Linux (more than can be said for USB). It is also more suited to peer/peer applications (which USB does not do)

As for cost.. Zworld/Rabbit Semi sells a little board (RCM3200) with a 100BaseT ethernet, 6 serial ports and a raft of i/o (including timers, encoders, etc.) for about $80 each, much less in quantity. The development kit includes royalty free software for the TCP/IP stack, including web servers, ftp server, telnet, etc. as well as all the socket stuff. It's programmed in C, fairly easy to work with, etc. I'm using these things for such diverse applications as servo controllers, antenna tuners, and sprinkler timers.

To make an ethernet TNC all you'd need to do is add the modem chip (although, you might be able to demodulate the audio with the onchip counter/timers.. certainly, the PWM output could do the modulation). The TNC code itself could be modified from the old PMP code, although, since the Rabbit processors have UARTS, you probably don't need to go to that level.

There are other very low cost Ethernet devices out there. I don't think there are ones on a PIC, but pretty darn close, I'll bet. If USB<>Ethernet interfaces cost <$30, you know the interface parts cost has to be pretty low. You pay a bit more to get the ethernet chip and PHY layer integrated on a board and working (hence the bucks for the rabbit parts). For that matter, one of those PC on a stick computers interfaced to a run of the mill generic 10BT ethernet ISA card (<$10 each) might be an approach.

I have one and it works fine. The main disadvantage is that it doesn't translate the satellite status messages so programs with skyview diagrams or satellite S/N tables (such as the Delorme apps like Street Atlas, TopoUSA, etc) show blank status screens although the tracking on the main map screen shows perfectly normally.

> The linix gpsd package (http://freshmeat.net/projects/gpsd/?topic_id=20)

Actually, I should correct myself and mention that UI-View does natively
support the Earthmate.   When I made the comment originally, I was thinking
in terms of dedicated hardware devices such as the D700, TH-D7, Alinco,
TinyTrak, KPC3+ trackers, etc which all require standard ASCII NMEA-0183.

I picked up one about a year or so ago from an ad in Circuit Cellar.
Forget what I paid for it, but I think it was $30. All it needed was
the RJ-45 jack. It was a 'web page' on a chip, and the package
had authoring software to incorporate whatever you interfaced it
to as the web page.

When you go to the Kenwood, check out the Fleet Management section.
There is some stuff just begging to be hacked for Ham use.

For instance, the KGP-2A:

The KGP-2A GPS receiver-modem unit and KGP-2B GPS controller-modem
unit from Kenwood offer a cost-effective way to implement an GPS AVL
(Global Positioning System Automatic Vehicle Location) solution*
into any two-way system. AVL offers efficient dispatch management of
taxi, delivery and service vehicles, plus enhanced security with
advanced monitoring and control capabilities.

http://www.siteplayer.com is another one, designed for controller
integration, with integral Ethernet. $30. About 1 square inch. (No, I don't
own any or work there. They just look cool.)

403. [aprssig] Telemetry progress

From: Steve Dimse <k4hg@tapr.org>
Date: Thu, 19 Dec 2002 09:16:43 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-111659-2002.12.19-09.02.19--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Here are a couple more refined examples of what the telemetry cgi will ultimately look like. This example plots a single parameter against time, and takes the same values that can be specified in the APRS on-the-air format...in this example, a voltage measurement that is one-tenth the telemetry value.

http://www.findu.com/cgi-bin/tele1.cgi?call=CNABAR&last=96&param=1&b=0.1&label=supply%20voltage&units=volts&autorange=1

You can also manually specify a range and tic count to provide a more consistant and attractive display:

http://www.findu.com/cgi-bin/tele1.cgi?call=CNABAR&last=96&param=1&b=0.1&label=supply%20voltage&units=volts&range=11%2014&tics=10

Again, the warning that this is experiemental, and meant as a preview only, applies, a link to this cgi will almost certainly fail before the end of the year!

Steve K4HG

That's the one!  I forgot the name.  I bought the little thing that's a
small PCB with single row connectors on either side.

Mike

They have been supposed to come up with a telnet server version and a more
programmable version for over a year now... these items have been in their
"coming soon" section forever.  This leaves the rabbit.

It sure would be nice if kantronics made an ethernet TNC... wow.... kiss to
ethernet.... that would be schweet. a kpc9612/10/100bt

While I am really interested in this discussion of a tnc with
alternate connectivity, I am trying to envision exactly how a ethernet
(TCPIP?) based tnc would be implemented. I an not criticizing, but I get
how a USB version would function, just not ethernet at a mac layer, as I do
not know how to implement that type of connection? I get a ethernet/RF
modem type thing, but that is not exactly a tnc???? Like wireless ethernet
modem at 128k or 256k ( aka the 900 mhz project which seems to be stalled
for many different reasons) or something is one thing, but fill me in on
what I am not grogging please??
I do not mean this antagonistic, I am really interested in the concept.

Virtually all languages and operating systems today provide a means for connecting via TCP. The TNC would be given a local address, the application program would open the conenction, and send and receive data just like they would when connected to the APRS Internet System.

In fact, with a little more programming in the TNC, it could be done without a single change to an application that supports the APRS IS, at least for simple applications like a single TNHC/computer combination.

The TNC could listen for packets like

K4HG>APRS,TCPIP*:!posit here

and use the payload to send a packet. Commands and configuration could be sent in messages, say to TNC, which would not be transmitted. Any application that supports the APRS IS would instantly work, of course with most apps only supporting a single internet connection, this couldn't be used as an IGate.

In a more normal mode, the TNC could be opened and packets sent and received just as the serial port is used, in most OSes there is no difference between a serial port and network connection from the program's view, they are just serial streams of data. The command could be a subset/superset of any TNC command set you favor...

It would seem like some or maybe all of the pieces already exist, as the Rabbit Semi Ethernet/TCPIP module already exists with serial code to talk serial through it is written. Is this the interface level we are talking about?? Just ethernet to encapsulate the serial commands and data to and from a "normal type" tnc?? This does not seem to be to difficult to build, although it would be an adapter to rs232 as opposed to integrated, but that integration could be addressed down the road? Some smarts to detect tnc to ethernet protocol sounds in order (routing?) , but an open connection duplex serial stream is pretty easy....Is this the right general idea?

That's the easy, compatible way, but beyond that there are lots of enhancements
you could make. For example, the TNC commands could be sent to one port and the
data to annother. Connected QSOs could occur through multiple ports. The TNC
could be made to listen for multiple connect callsigns, and direct each to
another port, or even another host...your TNC could be listening for my
callsign, and if someone tried to connect to my callsign in your area, the TNC
connects to my computer anywhere on earth through the interent. IGate code could
be written into the TNC, so that all you need is the TNC connected to your
internet to provide an IGate.

Lots of possibilities...

Rendered body type: text/plain

Hi All,
I am setting up HF aprs for a trip where there is no VHF/UHF coverage. I
wish to use AGWPE as the interface to allow the running of both the APRS
software and normal packet software.
I amusing a laptop computer which has only one COM port and I need that for
the GPS. So I need to use the printer port for PTT. I understand that the
port needs some handshaking links to fool the computer into thinking a
printer is attached.
Can anyone advise me of what links are needed..
Thanks
Ron Smith

I would think that you only need to fool the system that a printer is
attached if you're doing print stuff. In this case, you're just using a
pin as a 'port pin' operation.

Unless there is something special in your software....

Can't he also rig up an adapter to run 3-wire serial to/from the
GPS and still use one of the RS-232 handshakes for a PTT circuit?
That way he'd only have to rig up that one port.

Hi Curt,
I tried that and the aprs software reports cannot access COM port as another
program has control of it, in this case that would be AGWPE.
Cheers
Ron

```
The main answer is your question was once posed to Riley himself by yours
truly at the Boxboro Hamfest in 2000 with the following reply.   "Just as
with a repeater as long as the equipment can be "remotely" controlled by a
licensed ham ( IE: KPC3 and Plus etc.) it is perfectly legal to do".
However, It is also legal as was already stated for a non ham to turn
equipment off.  "The key element to remember is that the equipment must be
able to be turned off within the time limit specified by Part 97 should the
equipment malfunction"   Here's the word from the man himself, now take it
and run!!

Lee/KD4TQZ

On 12/10/02, ""Phil Pacier, AD6NH" <ad6nh@arrl.net>" wrote:
> I wanted to throw this out and see what you guys think.  I'm in charge of a
small task force looking into the feasibility and legalities of installing
APRS trackers in more Baker to Vegas relay race chase vehicles.  The
question we're trying to tackle is whether or not it is legal to have a
simple tracker (a device that only transmits a position beacon on 144.39
and has no other transmission mode or frequency capability) in the vehicle
with no licensed ham present.  My own thought was that trackers might fall
into the same category as digis and repeaters - there needs to be a
control
operator who is responsible for the transmission, but does not necessarily
need to be "on site."  For example, if a monitoring station noticed a
tracker transmitting erroneous data or harmful interference, a person in
the vehicle could be contacted to "pull the plug".  Is this too much of a
stretch?

The APRS community has been very accommodating when it comes to the Baker
to Vegas race, allowing tactical callsigns to be used in tracking
vehicles.
 Our goal is to get trackers in a majority of the vehicles so that team
members and viewers at home can watch the "virtual race".  It also serves
its purpose in emergency situations, obviously.

Any comments you may have about this would be welcomed.  Thanks for your
time.  Continue to check the Baker to Vegas java tracking page at
http://www.aprsca.net/bakervegas.asp - soon there will be more detailed
maps and a new interface for tracking.  Enjoy!  73s.
```

You know, if you had the source....

You could make the one program talk to a new program that does nothing
but interface to the serial port.

Then have the other program also talk to this new program that again,
does nothing but interface to the serial port....

There IS a ethernet TNC available, at least in Europe. It's the TNC4e, and a bit pricey, but it does have 3 radio ports, an expansion port, and the Ethernet interface. It appears that the Europeans are forging ahead with very high speed packet interfaces (the TNC4e does >600 kbps)..

People

Seems to me like there is a possible project. A multi-port ethernet TNC - that is if people are up the challenge.

Rabbit Semiconductor has a number of PLUG IN CPU/ETHERNET modules, which means that the hard surface mount stuff is on a board that is purchased ready built. They come with a 10/100 mBit ethernet... And for an organisation like TAPR we could buy the CPU modules on demand, and plug them in as required.

More details on the core modules is available on
http://www.rabbitsemiconductor.com/products/coreModules.html

They even have prototyping boards now...

I have done a dual port serial server at one stage with control for
bitrates etc on an additional port, but I have lost the code thanks to a
HDD crash (Mind you, that is all I lost).

I can see a multi-port TNC being made out of this thing... The serial
ports are good for high speed, and for low speed you can use bit
bashing. The CPU load on having 4 paralell RX or TX is not much more
than having a single one.

To do a project like this TAPR needs people. I would love to do it, but
I don't have any RabbitCore development boards, and I suspect that I
have enough things on my plate.

```
Proposal
        RabbitCore based ETHERNET TNC
        4-6 1200 bps Modems (based on MX614) with TNC-2 sockets
        2-6 two wire RS-232 IO ports (opt)
        Serial IP configuration through one serial port if an IO pin is
HIGH
        TCP/IP software so that an APRS server could telnet into this
box and get APRS packets
        4" x 6" PCB
```

Who is up for this project...

Darryl

Ron asked about AGWPE:

>I need to use the printer port for PTT. I understand that the
>port needs some handshaking links to fool the computer into thinking a
>printer is attached.

I don't think you need anything other than AGWPE configured to use an LPT
port -- and of course a change in the PTT-to-radio connection.

See: http://users.rcn.com/milnes1/soundcardpacket/cableptt.htm

(If you are running Windows 2000 there may be a bug with printer port use.
See #8 on this page for a work-around:
http://users.rcn.com/milnes1/soundcardpacket/probtx.htm

An option to the PTT port is to use a USB port (if you have one on the
laptop) and a Serial-to-USB adapter for about $30. They do work -- I run
with one 100% of the time.

73 and Happy Holidays!

```
Hi Ralph,
I tried that and the data lines go high and stay there. I have done some web
searching and the info talks about having to tell the printer port that the
data has been received, printer is ready etc, so that the next bit of data
can be sent. (The data outputs control the ptt).  If this is not done the
printer port just keeps sending the old info (keeps ptt on). When it
receives the appropriate acknowledgement the printer port will then send the
00000000 which will turn ptt off.
I will investigate the idea of usb to serial converters.
Thanks
Ron

Message-ID: <LYR842-111795-2002.12.20-14.15.56--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

A NEW digipeater satellite was launched today called SAFIR. It can be used for APRS!

Listen for it this evening with the same PCSAT downlink of 145.825, but it will be 9600 baud. Because of the 9600 baud, any Kenwood or Alinco with the built in 9600 baud TNC can receive it, though we dont know how strong it is. My recommendation is for everyone with a Kenwood to LISTEN at 9600 and everyone else without 9600 baud, TRANSMIT on the 1200 bauud uplink on 435.275 MHz +/- 10 KHz of Doppler. Even if you cannot decode your own donwlink at 9600, maybe you will hear a noise burst just after you transmit. The path is VIA the callsign of DP0AIS (thats a zero).

My suggestion is to be gentle. Maybe one packet every minute or so. or if unattended overnight, maybe one packet every 2 minutes.

We estimate these times:

USA passes are:

```
PST  MST  CST  EST
---- ---- ---- ----
          1826 1926
1805 1905 2005 2105
1950 2050 2150 2250
2135 2235 2335
2320 0020
0100           0400
     0340 0440 0540
0420 0520 0620 0720
0600 0700 0800
0745
```

On Fri, 20 Dec 2002, Oliver Amend wrote:

Hi Darryl,

> - that is if people are up the challenge.
> Seems to me like there is a possible project. A multi-port ethernet TNC

I played briefly with an Atmel AT90S8515 and some ATmega CPU's and a Realtek ethernet controller (same is used in the RabbitCore). There is a all integrated ethernet controller available from Crystal as well. I haven't invested too much time into this yet. I briefly worked on an embedded ethernet project but left it for the future in favour of getting an IRLP node and APRS iGate and digipeater up and running. I mostly read up on the intricate details of TCP/IP, UDP and open source development tools that support Atmel.

I looked at the Rabbit product and decided to go Atmel instead. For the most part this was based on my unwillingness to purchase proprietary development tools, when a just as powerful microcontroller has open source development tools available. Also, in my case, all my workstations are Linux, I don't use Windows. When I looked at the Rabbit, no Linux development tools were available. Yet another reason to not go that route.

I am very interested in this project, it really goes hand in hand with what I am trying to accomplish now using Baycom type hardware and multiple serial ports. Using ethernet instead of serial interfaces would most certainly greatly increase the flexibility of running multiple TNC's on the same computer. I'd prefer not to purchase a Rabbit Development Kit and use Windows as a development platform, though.

For ethernet connectivity there are a few prebuilt ethernet modules available that allow a microcontroller to be connected to ethernet, here are some of these resources:

Hardware (Ethernet):
http://www.embeddedethernet.com/
http://www.edtp.com/
http://www.siteplayer.com/
http://www.netburner.com/

Herdware (Atmel & Ethernet):

FWIW, the rabbit comes with a telnet application which will do KISS TNC right out of the box. The only scary part is that you need a way to validate who can connect and who can't if it's going to be on the public internet. If you are behind a firewall, you can have such a thing running in a matter of minutes right out of the box (in a one PC to one TNC application). you need only to install DHCP (if you choose) and the standard telnet application.

The problem I am having is that I'm not able to use this "virtual serial port" function which is included in the tcp/ip stack. I want a rabbit IGATE and it requires filtering local / internet traffic, and filtering opt-out traffic on RF as well as 3rd party messages. The little rabbit can't keep up on the full aprsIS stream. Serving one TNC to a few (like 5 or 10) PCs would not be a problem at all.

All of this raises the question... does anyone know of a Ethernet to serial adapter (like a USB to serial adpater) which is reasonably priced? Sheesh, ethernet chipsets are cheap, and if a 16f628 can talk with a USART, why hasn't this been made before? Hate to reinvent the wheel... and if such a critter were as cheap as usb to serial ($30), there is your ethernet TNC interface.

Wes

The TINI has a standard EtherNet to Serial application:

http://www.ibutton.com/TINI/applications/sertoeth/index.html

But it would take some work to get it at your $30 point.

If you mean you are using the printer port and sending a 'print byte',
then
yes, you may have to do that.

If you mean you are using the pins as 'port pins', then no, you shouldn't
have to do that.

To make a printer port appear 'valid', you will have to pull the 'status
lines' to a 'valid' state.

But, the 'ack' your talking about probably means tying the 'strobe' on
pin 1 to the ack. If you are sending a byte, the standard print drive
will
place a byte on pins 2-9 and then toggle the print strobe. (I have to say
that's a pretty poor way of doing it though...)

430. [aprssig] PROPOSAL : Ethernet 4-port TNC

From: "Darryl Smith" <Darryl@radio-active.net.au>
Date: Sat, 21 Dec 2002 18:51:24 +1100
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-111903-2002.12.21-02.42.51--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

People.

There is some interest in an ETHERNET TNC based on the RABBIT SEMICONDUCTOR CPU's. If you want to participate, please contact me directly. I will then work out how we do this.

Darryl VK2TDS
TAPR BOARD

Ethernet Enabled multi-port TNC based on a Rabbit processor.

Scope of Project

1. Develop an interface board for the RabbitCore TCP/IP processor modules with embedded Ethernet with the following interfaces
    a. Up to FOUR 1200 bps modem ports with MX-614's, PTT hardware, TNC-2 5-pin DIN sockets, Input and Output level adjustment
    b. Two (Four) RS-232 level two wire serial ports (depending on RabbitCore chosen).
    c. One TTL level serial port with optional RS-485
    d. LED's on Front panel for activity indication
    e. Programming Port so that no special cables are needed
2. Develop Software for this device
    a. Bit Bash-ed AX-25 I/O
    b. TCP/IP server with different IP port for each physical port
    c. AX-25 reception
    d. AX-25 over TCP/IP & Ethernet

Hardware

The Rabbit Semiconductor (http://www.rabbitsemiconductor.com/index.html) RabbitCore processor modules are to be used for this project. The reason is that this means that no surface mount work is needed to get the CPU working. It also means that the CPU CORE can be purchased on demand rather than during kit production.

I am proposing that the board accept either the older or newer RabbitCore modules by having two sets of headers.

10/100 RabbitCore 3000	$89
10 RabbitCore 3000	$79
10 RabbitCore 2000	$59

The capabilities of the 3000 series modules includes

. 10/100Base-T Ethernet
. Rabbit 3000T microprocessor at 44.2 MHz
. 3.3 V operation
. Low-EMI
. 512K Flash
. 512K SRAM (program), 256K SRAM (data)
. 52 digital I/O
. 6 serial ports (IrDA, SDLC/HDLC, Async, SPI)

Available Software

Some of the needed software has already been written and just needs to be integrated. This code includes

1. Telnet SERVER code with the Dynamic C compiler
2. AX25 receive code - Darryl VK2TDS

The software needs to be integrated and expanded.

Software Stages

1. TCP/IP server
2. Serial Configuration Port
3. TCP/IP Configuration Port
4. AX.25 reception - Single Port

5. TCP/IP Server on multiple ports
6. AX.25 reception on multiple ports.
7. UPROTO transmission of packets on single port
8. UPROTO transmission on multiple ports

Somewhere about this stage the product would be released, and it would be hoped that the ham radio community could complete the final stages. They would be

9. Connected Mode reception
10. Connected Mode transmission
11. TNC command set through telnet.

Development Kits

Many amateurs already own a Rabbit 'C' Compiler and can program these devices themselves. For those that cannot, a full kit of 'C' compiler, Core Module, Prototyping Board, Plugpack can be purchased for $299/349 depending on the model.

Deliverables

1. Prototype PCB design
2. Schematic
3. Working CODE
4. User Manual
5. Construction Manual

Resources Required

At this stage the required resources are unknown. We would anticipate that there be 1-2 versions of the prototype PCB constructed before the product is released. Thanks to the nature of this product it is not anticipated that there would be any advantage in going for a formal BETA release of the product once the board is designed and working.

Options for Sale

A number of options exist for the eventual release of this kit. They include
. Parts and PCB only, without CPU Core
. Full KIT

431. [aprssig] Re: Ethernet vs USB

From: "Michael Lussier" <k4mqf@direcway.com>
Date: Sat, 21 Dec 2002 12:37:47
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-111943-2002.12.21-13.23.27--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I recently played with a Belkin USB to serial adapter that gets it power from the USB port. I set it up a Com10: and I have it connected to one of my KPC-3. No complaints here with its abilities.
I'm using it on a machine running WIndows XP Pro. It appears to be no limitation as to how many of these you can have if you have a hub connected to your computer.

Let me say this though as a network person I would prefer an ethernet connection in place of serial. but I would also perfer at least a USB port as well for a programming backup port.

Mike K4MQF

Hi Mike,
I am not doing it. I appears that is what AGWPE does.
Cheers
Ron

Hi Ralph,
AGWPE is version 2002.10.
Windows is XP Pro.
Laptop is 2 weeks old.
Cheers
Ron

Yes, I found the easiest way to do it was to use Yaesu's single pin to dual socket adapter and split into the traditional 1/8" spk out and 3/32" mic in. Then wire it as you would normaly for a Icom/Yaesu like configuration. I finally broke down and bought a 1/8" four conductor connector with bare wire ends at a hamfest for $12! It was nice to have for making a very custom cable but hard to justify the price for several cables.

With the adapter I could just use all of my old cables that I had orginally made up for use with my RS HTX-202. Seems to work ok.

One thing about the VX-150, the packet deviation seems to be ok, but I have been getting low audio reports when using the HT for voice. Has anyone else seen this? When I get around to it I plan to order a service manual and take it to work and put it on my service monitor at my bench.

I have some pics of the adapter on my website under my Portable Packet and TinyTrak sections at www.ke4nyv.com

Hope that helps, 73's
Jason KE4NYV

I think Darryl is doing an excellent job on this project

-----Original Message-----
From: bounce-aprssig-30130@lists.tapr.org
[mailto:bounce-aprssig-30130@lists.tapr.org]On Behalf Of Darryl Smith
Sent: Saturday, 21 December 2002 17:51
To: TAPR APRS Special Interest Group
Subject: [aprssig] PROPOSAL : Ethernet 4-port TNC

People.

There is some interest in an ETHERNET TNC based on the RABBIT SEMICONDUCTOR CPU's. If you want to participate, please contact me directly. I will then work out how we do this.

Darryl VK2TDS
TAPR BOARD

Ethernet Enabled multi-port TNC based on a Rabbit processor.

Scope of Project

1. Develop an interface board for the RabbitCore TCP/IP processor modules with embedded Ethernet with the following interfaces
    a. Up to FOUR 1200 bps modem ports with MX-614's, PTT hardware, TNC-2 5-pin DIN sockets, Input and Output level adjustment
    b. Two (Four) RS-232 level two wire serial ports (depending on RabbitCore chosen).
    c. One TTL level serial port with optional RS-485
    d. LED's on Front panel for activity indication
    e. Programming Port so that no special cables are needed
2. Develop Software for this device
    a. Bit Bash-ed AX-25 I/O
    b. TCP/IP server with different IP port for each physical port
    c. AX-25 reception
    d. AX-25 over TCP/IP & Ethernet

Hardware

The Rabbit Semiconductor (http://www.rabbitsemiconductor.com/index.html) RabbitCore processor modules are to be used for this project. The reason is that this means that no surface mount work is needed to get the CPU working. It also means that the CPU CORE can be purchased on demand rather than during kit production.

I am proposing that the board accept either the older or newer RabbitCore modules by having two sets of headers.

10/100 RabbitCore 3000	$89
10 RabbitCore 3000	$79
10 RabbitCore 2000	$59

The capabilities of the 3000 series modules includes

. 10/100Base-T Ethernet
. Rabbit 3000T microprocessor at 44.2 MHz
. 3.3 V operation
. Low-EMI
. 512K Flash
. 512K SRAM (program), 256K SRAM (data)
. 52 digital I/O
. 6 serial ports (IrDA, SDLC/HDLC, Async, SPI)

Available Software

Some of the needed software has already been written and just needs to be integrated. This code includes

1. Telnet SERVER code with the Dynamic C compiler
2. AX25 receive code - Darryl VK2TDS

The software needs to be integrated and expanded.

Software Stages

1. TCP/IP server

2.   Serial Configuration Port
3.   TCP/IP Configuration Port
4.   AX.25 reception - Single Port
5.   TCP/IP Server on multiple ports
6.   AX.25 reception on multiple ports.
7.   UPROTO transmission of packets on single port
8.   UPROTO transmission on multiple ports

Somewhere about this stage the product would be released, and it would be hoped that the ham radio community could complete the final stages. They would be

9.   Connected Mode reception
10.   Connected Mode transmission
11.   TNC command set through telnet.

Development Kits

Many amateurs already own a Rabbit 'C' Compiler and can program these devices themselves. For those that cannot, a full kit of 'C' compiler, Core Module, Prototyping Board, Plugpack can be purchased for $299/349 depending on the model.

Deliverables

1.   Prototype PCB design
2.   Schematic
3.   Working CODE
4.   User Manual
5.   Construction Manual

Resources Required

At this stage the required resources are unknown. We would anticipate that there be 1-2 versions of the prototype PCB constructed before the product is released. Thanks to the nature of this product it is not anticipated that there would be any advantage in going for a formal BETA release of the product once the board is designed and working.

Options for Sale

A number of options exist for the eventual release of this kit. They include
.   Parts and PCB only, without CPU Core
.   Full KIT

I'm a bit behind on this list so excuse the late reply.

The Linux soundmodem driver is happy with open squelch. I think it
should be possible to get three sound cards working, if you can
physically fit them into the slots in the machine.

The db0lj site has a good collection of aprsd variants. Unfortunately
this work has not been merged into the 2.2.x versions on Sourceforge.

The AX.25 code in 2.15.b9 is the VK3SB sockets code. Hans has merged it
into 2.15 which I did not do; I am working on 2.2.x instead.

Rendered body type: text/plain

I have seen alot of discussion on the use of USB ports in ham
radio....this link is to the RS-232 GPS but they do have one for a USB
port. I wonder if this would work with APRS.

On 12/21/02 at 4:00 PM wb8nut@arrl.net (J.Duffy Beischel) sent:

>FeaturePrice (www.featureprice.com) is very reasonable shared hosting.
>Fixed IP address and unlimited traffic.  Very reasonable monthly fee.
>
The price is surprisingly low...in fact low enough that I have to question how
real the offer is. These are shared servers...you are on the same computer with
other users. They  list their servers as 800 MHz/512 MB, with 150 GB RAID
disks...the size of the disks indicates they put a lot of users on a single
server.

findU is presently the only application on a dual 1.26 GHz machine with dual 36
GB SCSI drives and 2 GB of RAM. Sometimes for 5-10 seconds at a time all the
resources of both processors are consumed, and much of the time the I/O of the
disks is limiting the response.

Placing findU, even as the only application on one of these servers, would be
very slow, if indeed it was useable at all. In a shared environment, I'm certain
it would not be useable. And I'd bet that when these guys find out what findU
consumes, they are not going to buy a mega-machine and devote it to findU at
$21.95/month!

Dig into the conditions, and you see they "throttle" individual users, at rates
similar to other plans. They say their http service is maxed at 17 MB/hr, or 15
GB/month, however that is not guaranteed, you can only use the bandwidth that
"does not interfere with other users on your machine". So, the more users they
put on a server, the less you can do, and even if you end up with a throttle of
1k/hour, they have met the terms of the user agreement. Always read the small
print!

Typical colocation (your server at their data center) rates run $50-$200/month,
for bandwidth limits of 20-50 GB/month. This would be the commercial option I
would need.

Fortunately the APRS community has come through with a much better deal, free
co-location without limits in a real data center fed by OC-12's. I had almost a
dozen offers, just took the best one, but I very much appreciate them all.

```
Saw this on the AMRAD reflector about mobile APRS operations using 802.11

---------- Forwarded message ----------
Date: Sat, 21 Dec 2002 16:56:36 -0500
From: Maitland Bottoms <aa4hs@amrad.org>

Point-to-point ad-hoc wireless networking. To and from the larger
hamfests [Dayton?]

1) Get hams to carpool to hamfests. environmentally sound, traffic
   congestion reducing, and lets someone other than the driver handle
   the radios, laptops, and antennas.

2) coordinate via standard 2m or 440 MHz NBFM radios, so that the
   vehicles in which two or more groups of hams are travelling in can
   be brought in closer proximity.
```

3) establish 802.11 links between vehicles. Exchange e-QSLs, try
   full-duplex audio and video communications.

Something to do on the way to and from Dayton this year.

Things to talk about before then: protocols for pre-arranged ad-hoc
network settings, protocols for e-QSL exchange.

As much fun as war-driving is, it would be really neat if a technique
caught on where, when two war-driving platforms get near each other,
they can exchange their found access point logs.

I found the db0lj patch for aprsd215b9 but haven't tried it yet.

> The AX.25 code in 2.15.b9 is the VK3SB sockets code. Hans has merged it
> into 2.15 which I did not do; I am working on 2.2.x instead.

Where is there a 2.2.x version of aprsd? I heard of it but I can't find
it. On http://sourceforge.net/projects/aprsd/ all I see is aprds-2.1.4.

So what's the scoop with these 2 different versions? aprsd215b9 is
maintained by wa4dsy. Who's looking after the 2.2.x variety?

Thanks,
Adi

I will need hardware DCD from the TNC. I don't think I can do that using a
soundcard modem. Since I started asking these questions, the ethernet TNC
idea has come up. I think that an ethernet TNC would be an ideal solution
to connect multiple TNC's to a single computer.

I work for a large telco.

We handle 60 ++ phone modems.

I have seen this done in two ways:-

1. Software DSP Modems on demand.
2. Hardware modems and RS232 to Ethernet conversion (Dedicated x86 Box)

Most everthing I see these days is going IP. I couldn't really understand why TNC
manufacturers wouldn't just leap frog USB and go LAN. Spose you need hubs then hey.
I have an old RS232 spooler here collecting dust.
I spose what we want at hams is addressable black boxes that do a task.
Ethernet being a suitable choice as it is expandable.
I think the great thing about the idea is that you could share the TNC with lotsa apps.
I now there have been cases where I was nutting out serial sharing, when ether would be SO much easier.

Cheers Andrew VK4TEC

I work for a large telco.

We handle 60 ++ phone modems.

I have seen this done in two ways:-

1. Software DSP Modems on demand.
2. Hardware modems and RS232 to Ethernet conversion (Dedicated x86 Box)

Most everthing I see these days is going IP. I couldn't really understand why TNC manufacturers wouldn't just leap frog USB and go LAN. Spose you need hubs then hey.
I have an old RS232 spooler here collecting dust.
I spose what we want at hams is addressable black boxes that do a task.
Ethernet being a suitable choice as it is expandable.
I think the great thing about the idea is that you could share the TNC with lotsa apps.
I now there have been cases where I was nutting out serial sharing, when ether would be SO much easier.

Cheers Andrew VK4TEC

Hi All!

I will point you to http://www.bcl.de to have a look on this little fine chip. It acts as an embedded webserver and I plan to play with it and combine it with my TM-D700 .....
What a idea: running JAVAprs direct on a TM-D700 serving the connected clients .....

Rendered body type: text/plain

I just installed the CE version for APRS. It works great and has a lot a
lot of features not found on the Palm versions. You can see weather data,
send messages from a real keyboard (although small on a Jornada 690), and
see ALL messages. Its perfect instead of a full size laptop and a better
viewed screen than a Palm for mobile use. Rob has done a fanstastic job of
making the program run smooth on the pre and post-palm size CE machines.
One of the features I like is being able to click on the screen map and pull
up station info. with out searching a list of call signs to find what I
need. This software when hitched to a handheld like the Jornada 690 is a
perfect marriage. I don't think the 690 is out of production but can be
found in a lot places.
BTW I have no compensation for this "Ad", just thought I would share a
little know piece of software that works great and offers utilization ease
for mobile use.

Here is the link to it.

I sure hope so (looks like it would no prob). A friend of mine here in
Casper, newer to APRS, just ordered up a serial version (from a
different retailer) to use with his Palm IIIc.

I'll know more after he gets it up and running.

Adi, take a look at the CVS on the sourceforge site. That's where I've
been getting 2.2.3 - though, I've no idea where to find the 2.2.5 I've
seen pop up here and there.

http://sourceforge.net/cvs/?group_id=23339  <-- 2.2.3 CVS 'info' site

Looks like most recent check-ins for 2.2.3 were made by Hamish some 5
months ago.

And yea - though I've asked the same question about the two versions
here a couple of times, and even received some decent replies - I'm
still a 'bit in the dark'. But then there're those that say that's just
a normal state of affairs here.

As to who's 'looking after 2.2.x' - you'll see that info on the 'home
page' for aprsd on the sourceforge site.
http://sourceforge.net/projects/aprsd/

click on the 'View Members' link under "Developer Info" and you'll see
(edited):

Chuck Byam         Project Manager

Everyone with a good short coax run, look to see if they heard ZR1CBC.
He is a South African Station which should be reported via the PCsat
store-and-forward on the 144.39 downlink.  It wont show on FINDU, because
it is in 3rd party format.

But anyone int he USA should capture it direct if they normally hear
PCsat-11.

ok you need to pipe the data on an interface and a port to a serial port, fooling the program
into thinking that the data is coming from the serial port

use netcat and divert the data towards /dev/ttySxx
```

```
nc 172.93.1.100 3000 > /dev/ttyS0
```

I will have to check the syntax of netcat, been a while but I had it working.

or you can do this in PERL.

telnet using a socket to host box, if activity, send to comm port.

I have had serial from a TNC to ether to serial working linux to linux no probs.

Andrew

Message-ID: <LYR842-112104-2002.12.22-18.04.41--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

(Commercial hard-hat on)
Spoken as an installer of 802.11 equipment, and NOT as a ham:

Consider this: Every cordless phone, leaky microwave oven and 802.11 lan in your path is going to cause reciprocal interference. Add to that the plethora of bluetooth micro-power devices you'll soon find attached to everything from cordless handsets to refrigerators, and you have to ask WHY BOTHER? DO you REALLY want to enter one of the most interference prone pieces of spectrum, with a noise floor rising daily?

Those of us who put this stuff up for wireless computer connectivity are running out of spectrum, and as much as I hate to mention this to hams, the FCC is more than willing to give us some of YOUR spectrum most any time we petition for it. So wave farewell at 1.2 ghz, 2.4, 3.3, 5.6 10 and possibly higher freqs real soon.That 24 ghz band is making some commercial entities drool right now..
You make minimal use of most of them, consumer usage takes priority, so get used to it. Intel and microsoft are presently making plans to ask for more spectrum, and as you know, its use it or loose it.

Yes, I realize its a gun-smoke shoot 'em up at 2.4 and increasingly at 5 ghz for connectivity, but why do you insist in bringing your hobby stuff to a band that's already overcrowded, where we are trying to get high speed Internet to people just like YOU who crave that bandwidth. It seems if there was a ham market for this stuff, it would be only a simple matter to get similar connectivity in the bands you occupy near our band edges. Oh I forgot, if you cant buy it at a hamfest for $99. you don't open the case

anymore. Experimentation is a dead art for most hams. Maybe you better talk to the manufacturers of those $3000 HF radios about providing some high speed interconnects at microwave for reasonable prices. Play in your bands, but if you insist on using the few ones that are used for wireless interconnect, don't be at all surprised when someone get paid off at the FCC to come after one of your cherished allotments. You remember the UPS fiasco that cost you a chunk of 220? and now sits mostly idle... the incursions into 440?
Get used to it, its only going to get worse.

(Ok, Ham hat on)
Now before a flame fest breaks out, I'd love to see a modular approach, software driven radios that you can plug in the RF module of your choice, and the IF module of the given band to enable high speed connectivity. This would get you past the FCC regs as far as type acceptance, and allow OFDM or other advanced techniques to be constructed in a block manner. Of course, if it were easier and cheaper, more would be doing it. The bandwidth is out there, hams have a lot of it, it's increasingly incumbent to utilize it or loose it. Any manufacturers listening to this?

You have to get 2.2.x from CVS directly, as there have not been any
releases.

> So what's the scoop with these 2 different versions? aprsd215b9 is
> maintained by wa4dsy. Who's looking after the 2.2.x variety?

Chuck Byam is doing most of the work. Dale has also been involved.

Why do you need hardware DCD? The soundmodem will run with the squelch
always open on the radio - what do you need beyond that?

> Why do you need hardware DCD? The soundmodem will run with the squelch
> always open on the radio - what do you need beyond that?

I am trying to do the MIC-E thing on a voice repeater. This will require
DCD available for the repeater controller so the data bursts received
aren't transmitted by the repeater.

Here are a couple of links about the concept:
  http://wes.johnston.net/aprs/aprs5.htm
  http://web.usna.navy.mil/~bruninga/APRS-docs/MIC-E.TXT

I need to find out if this gps does work. I have VisualGPS to test with but
can't get anything out of it.
Its a mag mount type with a rs-232 and cig lighter connector only. Looks
like a PC mouse.
Anyone here know or use this type of gps before?
Thanks
Mike kb5wbh

Ahh, but you must not be aware of the latest good use of 2.4GHz. ATV
transmitters emitting NTSC video signals will be falling out of the woodwork
as the swing to HDTV occurs. So, just get ready. 1/3 of the 802.11b spectrum
is about to disappear to amateur radio use. And, it is VSB modulation, so we
can use 100's of watts out with 1000's of watts ERP. The result will be post
disaster live television services to local EOCs, live weather spotting around
large community areas, etc.

The ride ain't over until all the wheels stop turning...

If the commercial entities are working on bringing us high speed internet
access, then why don't try lowering the prices? $45+ per month for dsl or
cablenet is simply too expensive. If it were on the order of what a regular
dial system costed then allocating some bandwidth is feasible. And as
technology progresses and the higher bands are allocated then the "lower"
bands should be abandoned and given back to hams. Is that too much to ask?

```
I don't think $45+ per month is unreasonable when you consider the costs
involved in bringing fiber optics to my remote rural area.  I have Charter
cable internet service and love it.  Since I am a Charter cable subscriber I
save $10 a month and only pay $36/month for the full time high speed
internet service and that is cheaper than what I was paying.  My old ISP
cost me $19/month and my wife insisted on a second phone line that cost me
another $25/month, so not only am I saving money, but I get speeds that are
unbelievable.  I can download a 5 Meg file in 3 to 4 minutes!  That size of
a download used to take 20 to 30 minutes on my old ISP and I had to pray
that I did not drop off line before the download was completed!

For what I get, I think am getting a bargain but don't tell Charter, I don't
want them raising my rates.  Hi, hi....

>While I am really interested in this discussion of a tnc with
>alternate connectivity, I am trying to envision exactly how a ethernet
>(TCPIP?) based tnc would be implemented.

Along these lines, can anyone tell me if there is a simple
cheap (and fast!) A/D that I could connect to my PC to
received the digitized samples over ethernet?

The TNC (and A LOT MORE!) could be implemented on the
host PC. If we could A/D at a fast enough rate, you could
digitize several packet frequencies all at once.

Douglas KA2UPW
Looking for a really fast, cheap, A/D over ethernet...

I for one would have to agree with you, I have been talking with Rob and he
is working on a few things for the next version. I will let him announce
them as I don't feel right doing it without his permission, bit believe me
the projects in the works will be well worth it. I run APRS CE on a Jornada
on a 680 and have it mounted on a RAM suction mount/ plate to the
windshield to the car for easy viewing of stations and messages. Makes a
nice setup for portable use with either the Pico Packet or the D7. I run a
Garmin GPS 12 for data and either the D7 or the Pico with a VX-150 for the
station depending on the situation. I am hoping to see the a CE version that
will support a weather station wired into the unit for fireground command
post data in the near future.
Thanks again Rob!
Peter- N0WRE
> I just installed the CE version for APRS. It works great and has a lot a

I would have to agree with them. I live in Cheyenne and DSL is the best thing for me and the ability to have instant access to the local gate for traffic that would take forever on a dial-up would be mind numbing. Pages that have a lot of data such as NWS radar images take a LONG time to download on dial up, when some ISP's get the ball rolling and get above 33.6 connect speeds for the average user then we might accomplish something. I for one like the speed and the price I would pay for the access.

>to be coming from? Will there be matching ATV receivers? What's the
>connection to HDTV?

The switch to digital format will be causing many NTSC transmitters to be decommissioned. In our neck of the woods, we have a cable TV over RF provider which uses RF at 2.4GHz to deliver 'Cable' TV services. They have downconverters that you put up above your house, that downconvert their range of channels to a range of true cable TV freqs. What ends up being true is that our clubs 2.4GHz ATV freq corresponds to Cable channel 14 when using this device. Their channels start a little higher to get past local TV services, so there is a hole there that will allow several channels in the Amateur range to be downconverted.

They have, off and on, had equipment being decommisioned, just in regular use. We have been given advanced notice of some of their dumpster fillings. There will continue to be more opportunities...

The connection to HDTV is that the digital transmission mode used won't be compatible with the Video Rabbit and BSR X-10 low power 2.4 GHz video linking hardware. I'm not sure just how valid this is, or how soon it'll really happen, because it'll be a while before TV's without analog reception capability will exist, especially with the relatively slow uptake on HDTV currently. And a lot of the applications of these cheap wireless links won't go away, because the picture available from the TV that's being used will continue to work just fine for the job at hand, until the camera, link, or TV die. Links like remote video surveillance cameras.

Humorously, a friend brought one of these to the Seaside, OR hamfest, and we discovered that when he flipped through the channels, there was a camera and transmitter that (probably) the police use to keep an eye on the street out to the traffic loop on the promenade. This is a popular hangout area for kids from NW Oregon on the weekends, and I assume the PD uses this to help decide when increased patrol coverage might be desirable.

This basic hardware could be used by hams now to drive power amplifiers for ATV applications. It's not currently simple or cheap to achieve extremely linear amplification in this frequency range, and it's necessary for AM video to be amplified with good linearity or spectral regrowth and poor video fidelity will be the result. Also, it's a fair possibility that these cheap systems are direct AM, not VSB - after all, it's not particularly important to the manufacturers that the transmitters be narrowband - and it's a lot more difficult and expensive to make a VSB transmitter than an AM transmitter. And if what's used for receiving is a converter, the receiving TV set also doesn't really care whether there's lower-sideband information or not - it's a VSB receiver.

I'm not saying that amateurs shouldn't use this gear this way, or even use an amplifier on the transmitter - not at all. It's just not all that simple or inexpensive to get high power out with good fidelity for AM/VSB TV. If hams want to maintain good video quality, going to FM TV would make more sense, especially if you can figure out how to cleanly run a microwave oven magnetron as an FM PA! Then you will want to match it to a coaxial or waveguide feed to feed your converted C-band 10' rooftop dish...

73, and Happy Holidays

I suspect this has been covered several times before but I seem to be having a bit of a battle with the APRSSIG Archive search engine reporting 0 results found.

I am trying to understand how I query the database directly from an SQL Query, perhaps embedeed in a VB Program. Assuming I figure out how to write the SQL queries is the access method and DB schema documented anywhere?

Thanks in advance,

Peter

>the SQL queries is the access method and DB schema documented anywhere?

Currently there are three hosts with open sql ports, www1, www2, and
www3.findu.com. for experimenting I prefer that people use www3 so as to avoid
the risk of bogging down the production machines.

the account is guest, there is no password, and the database name is aprs. This
account is read-only.

The tables are not documented, but sql includes commands to show the tables and column names, so you can figure it out, the names are self explanatory.

The rules are no joins, and no guarantee that this will stay open. I monitor the slow query log, and if I see some inappropriate queries then I may need to restrict the port to approved users only. It is quite possible with a single line command to essentially bring down the server.

Having gotten no errors when I asked people to check for trouble with the new server, I have switched over findU to point at the new server. I'm watching the error log, not sure if I'll leave it or switch it back before I go to bed. Please report any problems ASAP!

I'm very familiar with the Rabbits. I have 2 pair of them - the original and the synthesized. Both 900 MHz. I also picked up a 15 watt linear at Dayton that works great with them! I don't think there are many of them out there now and don't see how HDTV will affect the supply of them. There will be analog stations out there for years. I don't know anyone who plans to buy HDTV any time soon. I can't remember when the FCC cutover date is, but I'm sure it will get extended out due to the slow sales of HDTV rcvrs.

"Hot Mineral Spas" in the "North West", why, you must mean Thermopolis Wyoming!

http://www.thermopolis.com/pools.html

Plus, with the recent addition of KD7AGA-5 on Copper Mountain, there's good ARPS coverage in Thermopolis too.

Enjoy

```
Well Roger has given us another enhancement to UI-View with this UI-NWS
enhancement.  It just gets better and better.  So if anyone is interested
in seeing a live UI-View map containing weather warnings, go to:

http://www.wb8nut.com/APRS.html

The red colored areas are warnings and the yellow areas are advisories.
```

They should be there into Christmas morning.

If you're not on UI-View yet, you are missing a lot. BTW, the map that is loaded to my web site every four minutes is a Precision Mapping map.

Merry Christmas!

Duffy

If you have a palm OS based pda, check out, pocketsat+

http://www.bigfattail.com/software/pocketsatplus/index.html

It's shareware, but does have a "non registered" mode.

I've used it and really like it.

491. [aprssig] UI-View32 Has Come of Age

From: "hasan schiers" <schiers@netins.net>
Date: Tue, 24 Dec 2002 11:49:25 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: <ui-view@yahoogroups.com>
Message-ID: <LYR842-112302-2002.12.24-12.35.26--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

This is an update mini-review of UI-View32 latest release, version 1.86

With this release, UI-View32 has come of age, at least for USA Stations

UI-View32 is a full-featured APRS client with all the standard features that we have come to expect from modern APRS programs. It supports all the following features and many more:

Dynamically Zoomed Mapping with Precison Mapping 5.x
Internet Gateway
AFilter Comapatiblity
Multiple TNC's with AGWPE Packet Engine
Digipeating with Kiss Mode (WideN-n,TraceN-n, and mutiple aliases)
Weather Stations (including reading wx file from 3rd party software
Station Lists (full and by category)
NWS Warnings displayed on Map and List with Details (Shapefiles)
Internal User Configurable Filtering
Extensive Use of Sound Files if desired
User-Defined Favorite Map Views
Remote Command Support
IGate Traffic Monitor with Local Station List
Local Terminal Monitor Window
IGate Station List with Details
Internet Time Set
Street Atlas Map Grabber (for those not wanting PM 5.x)

Incredible 3rd Party Support for:

Mobile tracking (UI-Route)
Weather Display (UI-Weather)
Propagation Analysis (UI-Path)
(Many more, too numerous to list)

Each one of these 3rd party add-ins would require their own review, but suffice it to say they are amazing in their own right, yet do not bog the computer down. I have all of the above running, with EchoLink and UISS on the same machine and only use approximately 7% of available CPU cycles as reported by TaskInfo. (WinXP Home, 512mb RAM, 1.1 gig Celeron)

Perhaps the most striking new feature is the NWS support. Roger's implementaton of this feature is outstanding. When used with Precision Mapping 5.x (PM 5.x), the color display of the county/zone warnings is striking. Further, the manner in which the warnings are listed is a great visual aid, not to mention double-clicking on a warning area on the map, results in the display of a "detail box" of information about the warning AND multiple detail boxes can remain open at the same time. They are closed by double-clicking on the detail box.

At the top of the main window of the NWS display, if one clicks on the text of the warning, the map zooms to the area of the warning, and the amount of zoom is customizable. In fact, many things are user definable, including colors used, method of overlay, background, etc.

Note:

Many people are under the impression that the add-on program AGWPE is for sound card tnc's. Actually, no sound card is required, and one can use this fine program for TNC control in KISS mode. The benefit of this is that one can have multiple applications accessing the same TNC at the same time. One can also use "remote serial ports" on a network. My main TNC for 144.390 is NOT on the same machine that UI-View32 is running on. I currently have two tncs being supervised by AGWPE. One on 145.800 (for ISS) and one on 144.390. They are on totally separate machines, but AGWPE with UI-View32 makes them accessible so that UI-View32 can gate the packets heard from ISS onto the internet. This is a neat way to gain serial ports, if you have a home network. Only one copy of UI-View32 is required. A copy of AGWPE is run on both machines. Processor use is less than 5% on a 400 Mhz Celeron running AGWPE. Additionally, I am running the program UISS as a terminal program for Space Station (and PacSat) packet operations. This has simultaneous access to the 145.800 TNC used by UI-View32! I also run a program called AGWPW Terminal on the 2nd machine to monitor all traffic on 144.390. Extensive use of color in this terminal program is a real asset.

I highly recommend running AGWPE for a hardware TNC in KISS mode. The result is simultaneous access, and UI-View32 can implement its powerful smart digipeater functions, as well. UI-View32 will allow the same digipeater functions without AGWPE, if it is run in KISS mode or another special host mode. AGWPE gives multiple access and networked tnc support.

Summary:

UI-View32 has become the "Swiss Army Knife" of APRS programs, without being a resource hog and is ROCK SOLID STABLE. In several months of operation as an Igate 24/7, I have never had a single crash. Not one! The program is fast, efficient and reliable. To top it all off, user support is unprecedented. Roger is on the mailing list, ui-view, which is very active and populated by people who like to help and support the software instead of bickering about ...well, everything. Roger is very fast in responding and has gone overboard to help users who experience difficulty. One testament to the reliablity of the program is that I have yet to see a single report of a problem from a user (including several by me), that were not the result of cockpit error. There are many web pages for downloading and support. The add-ins are all FREE.

Roger's UI-View32 program costs approximately $15.00, yep 15 bucks!!!

Precision Mapping 5.x is about $50.00, but is strictly optional, although I love it!

disclaimer: I don't work for Roger, nor do I receive any monetary or other benefit from his or any other program.

If you want something that is loaded with features, easy to use, fast and cheap, UI-View32 1.86 is your BABY

Hi,
   Is there an easy way to check to see if my Garmin 45XL is sending an
output to the D700? I am not sending anything and I don't see anything wrong
with the D700 settings. So, I guess that it is either the Garmin or the
cable from the Garmin to the D700.
TNX, 73 and Merry Christmas and a Happy and SAFE New Year,
Dave N0EOP

Make sure you have the GPS set to NMEA data output NOT Garmin!

It is a common mistake and also I have had it reset to Garmin on occasions,
so whenever you loose your GPS data, check that setting first.

If it is set to NMEA and your D700 is not receiving the data, I would
suspect it is a cable problem rather than a GPS problem.  Your D700 will
have the GPS letters in the display flashing whenever it receives valid GPS
data.

Subject: [aprssig] RE: TS Question

Make sure you have the GPS set to NMEA data output NOT Garmin!

It is a common mistake and also I have had it reset to Garmin on occasions, so whenever you loose your GPS data, check that setting first.

If it is set to NMEA and your D700 is not receiving the data, I would suspect it is a cable problem rather than a GPS problem. Your D700 will have the GPS letters in the display flashing whenever it receives valid GPS data.

496. [aprssig] RE: TS Question

From: "Herb Gerhardt" <hgerhardt@charter.net>
Date: Tue, 24 Dec 2002 17:03:44 -0800
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-112334-2002.12.24-19.49.31--lyris.aprssig#tapr.org@lists.tapr.org>

Rendered body type: text/plain

I see there is a PMON setting on the bottom bar under the APRS menu. I presume this is the setting you are talking about.

When I push this button, the display gives you the raw incoming APRS data. The same as a TNC would see. This button has nothing to do with the GPS data from the GPS you have connected to the radio.

If your GPS data is getting to the D700 which means the GPS characters are flashing, then you could read out the lat/long on your radio display by pressing the POS button on the bottom bar under the APRS menu. This will give you the current GPS lat/long.

Hope this helps,

Interesting application for nextgen GPS-enabled phones.

Wonder how much or if they might have 'borrowed' anything from APRS.

Thanks to everyone for the ideas. Maybe tomorrow before I go to work I can
try some tests. I guess that I should have said that I have had this working
for the last 9 months. The GPS on the D700 isn't flashing and the GPS is
getting a lock. I'll let you know what the outcome is.

Again thanks and have a MERRY Christmas,
Dave N0EOP

Rendered body type: text/plain

```
Hello to all,

I don't have an elmer around, so I come here looking for help.
I connected a Kantronics KPC9612Plus with a GPS Garmin eTrex. I made an
short cable with a DB9 in one to attach the data cable of the GPS and a
DB25 in the other end to attach the TNC. I set the TNC in GPS mode and put
everything in my car. When I came inside home to see the beacon on the map,
it showed as a Yacht.
My questions is: How can I modify the settings of the TNC in order to make
the beacons send the icon of a car, truck, or other vehicle?

Thanks in advance

Hi Neville.

Perhaps this information will help.

http://www.dididahdahdidit.com/text/symbols.txt

The client programs (WinAPRS, APRS +SA, UI-View, etc) display some icons
differently. However, the car, & truck icon is the same...I think.

Also, see: http://www.jarviscomputer.com/jim/aprs-symbols/

I am building a full-time, unmanned I-gate & have hit a problem.

I cannot find a way for the PC to power itself back up after a power outage.

Shorting the power switch does not work. Since it's a low-level connection to the motherboard, it powers-up, then powers back down after about 10 seconds.

BIOS settings have been of no help.

In normal use, the PC works very well.

A UPS is out of the question, due to availability and / or cost.

Has anyone here on the SIG overcome this problem using a recent vintage PC?

No alarm clock type setting in the power management? That's annoying. Most modern machines have a power management option to make sure the machine is running (and/or not running) between certain hours of the day.

> In normal use, the PC works very well.
> A UPS is out of the question, due to availability and / or cost.

A decent UPS is only $30-$50 these days... At least one good enough to run through a brown out or power surge. Seems almost mandatory for a dedicated igate that is powered from the mains.

> Has anyone here on the SIG overcome this problem using a recent vintage PC?

Could you perhaps build a circuit to detect whether the machine is on and have it pulse the power switch if it is not? A simple one-shot (monostable multivibrator) circuit would probably work well enough. Trigger it using the power LED off state and pulse the power switch signal low (or high, or whatever that motherboard takes) for a second or so. In theory, that should turn the machine back on when the power LED is off. You could probably build the whole circuit for under $1.

Rendered body type: text/plain

Greetings all-
I recieved a new Radio SHack wrieless weather station (63-1016) for
CHristmas. It is very nice- rain, wind, temp/baro, etc. Has anybody ever
interrfaced one of these with an aprs setup? I have a kpc-3+ here in the
house running APRSpoint (which I'd switch away from without too much of a
fight). My questions are these:
1. Should the wx station be connected to the computer's serial port or to
the tnc's seond serial port (y-cable, etc.)
2. What pc aprs program supports this station? Does winaprs setup for the
wx-200 emulate this?
Thganks in advance for any advice.

Does anyone know where to tap on to the data output of the GM Onstar
system. I would like to take advantage of the built in GPS data source to
feed my TNC.

Check the WeatherDisplay web site (a 3rd party weather station software
package). It probably supports your weather station, but perhaps under
another name (like Oregon Scientific). Weather Display writes an aprs
compatible file to any location you want, which programs like UI-View32 and
APRS+SA will read in and use.Very nice.

Further, Weather Display is a "knockout" weather program. Terrific support
and continual development.

Do a google search for Weather Display and you will find it. The author is
in New Zealand.

Thanks to all who emailed advice to me about my new weather station. I've taken that advice and set up the system with Weather Display and UIView. Just to echo the comments of others- UIView is a great program! I'm using it with mappoint maps (through UIPoint) and it works well. The weather display program creates a nice log file which is read by UIView. I had been using APRSPoint, but it lacks a lot of functionality and is never updated. UIView is easy to set up and use and it can still use the mappoint maps (which are very nice). I'm glad I jumped on the bandwagon!

Phil:

I don't believe the original posting sought ego boasting, it sought peer review. As such, I have to disagree with your implication peer review should be suppressed on the APRS SIG just because it may not be politically correct or one doesn't like to hear it.

If an experimenter seeks out peer review, then they had better have tough skin, which is the whole point of peer review. Go work at a University doing research and you'll really get your feelings hurt if what you saw bothered you.

That much being said, I don't agree with all of what blitz said, yet in any peer review situation, if all you seek are "YES MEN" it is essentially worthless. So I commend him for taking the time to critique the proposed experiment, as should any other experimenter seeking peer review.

If these responses keep someone from experimenting, the fault lies with the would-be experimenter, not with the nay-sayer. Too many people expect instant gratification, instant recognition, for just having an idea.

Edison said it best, "Genius is one percent inspiration and ninety-nine percent perspiration". Having the idea is the easy part...making the idea work is the hard part. Anyone deterred by negative comments on this list probably does not have the internal motivation to see a project through to completion.

Innovators are self-motivated, and derive their satifaction from seeing an idea through to implementation. They aren't approval-seekers, looking to please others. Nice when it happens, but it is not the primary motivation.

And is there less innovation and experimentation in ham radio than there used to be? Certainly that is the common perception, but I'm not convinced. Lots of great things have happened in the last two decades...I think what is happening is people's perceptions have changed. We are used to accelerating change in the rest of the world, so the more "normal" rate of change in ham radio seems slowed. Looking back into history time compresses, but look at the major innovations in ham radio, there haven't been that many, and they've been spaced out by years...it only seems like they followed on each other's heels.

So, want to experiment or innovate? Just do it, ignore the critics. Want to be the critic? Go right ahead, but wouldn't it be more interesting for you to put that energy into your own project?

I guess I lost the thread...

but my original question was along the lines of:

1) given that you can drive just about anywhere and find 2.4 GHz wireless access poitns, and

2) APRS-IS and FINDU.COM etc are all connected to the internet

So what does it take in the way of middleware to let HAM radio war-drivers with 2.4 GHz wireless cards in their vehicles, to tie into APRS-IS? Either input, output or both..?

I admit, this is all beyond me at the moment.. but maybe someone can address what it would take to glue this alltogether into something FUN... or maybe even useful?

Is there some kind of UDP packet that can be sent into APRS-IS wihtout a full connection?

Bob

And perhaps why we take our experimentation outside the ham bands, then make it a commercial project, make money off of it, and sell it back to you at inflated prices.

Actually, there is a good reason, and its got more to do with the horrible prices of equipment to get a decent shop set up. I've serviced land mobile radio for a couple decades now, and have seen the days when a venerable HP608 sig gen and a $100 freq counter needed to be replaced with a $20,000 signal generator, and a $5000 frequency counter, so this complaint is a non-starter. Who's going to buy in at those prices?

I still experiment, Ive been quite active in spread-spectrum, RTTY,
microwave and software controlled radios, and I can tell you when its ready
for market, some Jap company will be the only one to manufacture it, and
you will be more than happy to open your wallet and spend the big bucks, so
you can show it off to your friends.
However, the costs of getting started in any of these areas will
undoubtedly cost you more than what's already in your shack.

Couple that with the lack of parts and the lack of knowledge in the
upcoming areas of experimentation, and you'll see why its a dead issue.
Sure you can still build a chirp generator for 40 meters and call it a CW
transmitter out of an old TV set and some parts from Mouser, but who even
knows how to send CW any more? From what I see in the reports, most
licenses are bought now, not earned. Listening to some of the hams on that
dying but nevertheless huge allotment of CW frequencies gives new light to
the old Q-signal QLF....Its either that, or they're sending 300 wpm with
their computer, and getting a 1 in 100 letter decode and wonder why no one
wants to talk to them, or even decode their CQ for example. Most likely its
because theyre running their killowatt into a 4 to 1 SWR and have to reset
the computer after every sentence.

I have a lot of respect for Bob, he's a breath of fresh air and I love
satellite work, throughout the PCSat project Ive been there, and doing my
share of playing with the bird. I love it. Most of this stuff isn't for Joe
ham, who would rather sit on the local repeater and be obnoxious to his
fellow hams. Theres certain parts of the hobby that don't interest some
while other parts interest even less. Over my 35 years of hamming, I see
everything from 2 meter CB to the arcane and to each his own of course.
Remember bragg cells? That's the wonderful thing about the hobby, you can
participate as much or as little as you want. Even the Internet has opened
up new facets of the hobby, from FINDU to being able to sit half a
continent away and bitch about something you don't like in email and get a
response without ever turning on a radio.

I just grin and bear it, I suggest you do likewise...your blood pressure
will thank you....

If they can find an open WAP with passage to the Internet, the same client software they use at home to access APRS-IS will work mobile.

> Is there some kind of UDP packet that can be sent into
> APRS-IS wihtout a full connection?

Not necessary (and UDP is very ugly regarding security). 802.11 in conjunction with the networking software on the client end makes the client "believe" it is attached via a LAN to the network. I know this is an oversimplification, but the result is accurate. There is nothing special that needs to be done to APRS-IS client software to make use of open wireless networks. The downside is, and this is true through out the country, is that as you move, you rapidly go in and out of coverage causing your IP address to change and many wireless networks don't have a way to get to the Internet. IMO, for any type of true mobile use, 802.11b and 802.11a access points are too limited in coverage due to the numerous discussions on this SIG about equipment limitations and multiple frequency uses.

A presentation at DCC suggested that hams could take advantage of the 802.11b channels that fall within our band by creating higher power "ham radio" WAPs for applications such as this. Don't know if anybody has pursued this further, but it is a possibility.

I agree with Steve here. Bob's initial comment made me get off the sideline and join the 802.11x crowd. I bought my wife a AirCard and I purchased a Orinoco Gold card along with some machine made jumpers for MCX and RP-TNC connectors on Monday. Call it a mix of scanning and DX'ing but I installed Net Stumbler and started driving to see what was out there and was surprised as to the numbers of AP's in homes and more surprised at the number of AP's in businesses without ANY WEP. Call me a wardriver if you like but I would much rather consider myself chasing beacons and learning about propagation.

Today I received my 2.4 GHz magnet mount and headed out to see how much better it was. It was very interesting to see that in some places the external antenna helped while at others it did not. This does not really relate to APRS but I am learning about the band and what does or does not work, not to mention many of my AP settings have been changed based on what I have learned.

Can a small community with amateurs accomplish something on the 2.4 GHz band ? Yes but you got to start learning somewhere that that is what I have done. Can we use these AP's to do APRS-IS while on the road in someones network coverage ? Yes but then we get into a morality question here, it is a VERY gray area.

Get out and learn...yes it may cost money but so does that whiz bang 1kw amp and all you can learn off of that is how to tune it up so it does not smoke.

Rich K4GPS

Rendered body type: text/plain

More fun with UIView- I loaded in the tiny web pages server add on from
PD0RHM. It works by referencing an overlay file upon query. Just to play, I
loaded in .pos for a local hospital, police station, electronics store, two
repeaters and a weekly net. A message sent to my home station of "??" will

return the command options (?HOSP, ?POL, etc.). A message sent with the command line will post an object that can be navigated to. Very cool and easy to use! It worked flawlessly with my D7.

Next time you are in southwest Houston (near Sugar Land), try it out!

Rendered body type: text/plain

G'Day

Well, I have been playing with GPRS tracking - based on the GPS phone system that most of the civilised world uses... I did a 1 hour drive each way on christmas day, and a four hour break in the middle.

I was beaconing once a minute on GPRS. When I got home I found 17 TCP/IP connections to my laptop - all still active, although none were actively sending data... Seems that when the gprs looses signal with how it is implemented down hear and you get assigned a new IP address for the GPRS unit, then a new connection is opened... But the old one stays open for hours just in case you go back into that cell...

This is going to be fun when the 13,000 police in NSW start getting this same equipment into their cars...

Anyway my point... This data could go straight into the iGATE system with some minor work, but realistically some work is needed first on a remote system to reduce the sheer number of connections, and to kill off ones that are not passing data any more.

Darryl

P.S. One of my clients is going to pay me to write such a server, and convert the IMEI (GSM version of the ESN) into callsigns..

By default, some TCP/IP will not do any kind of keepalive. What you appear to be seeing is that your network connection was severed on one end by the fact that th RF path failed due to you leaving the area. If the other end never tries to send any data, it will never get a response (or lack thereof) telling it that the socket is invalid.

In a dynamically addressed network, without address reuse, some more interesting things can occur as well. Network applications and distributed computing has to take failure into account. Keep alive in both directions is essential if you don't want to have stale connections laying around...

Hello to all,

I want to thanks all the people that wrote to me answering my question.
Byron Smith WA6YLB; Reid KC0IDI; and Cap Pennell KE6AFE
I got couple of choices now. Furthermore, I have learned more than just an awser to my narrow question.
Thanks again. I really appreciated your attention and time.

>

You need a BIOS upgrade or possibly a new motherboard. Nearly all current motherboards that include soft control (i.e momentary pushbutton instead of locking rocker or toggle switch) of the power supply now have a BIOS setup option, usually under "Power Management" or something similar, for:

```
     State after power interruption:
          Previous State,
          Always On
          Always Off
```

This option is intended to allow servers to recover and reboot unattended after a power failure (or to allow a machine to be powered up from an external switch when a modem detects a ring), and is exactly what you need for your application.

I use the option "Always On" to allow a machine to be turned on from an external power center's master switch. You let Windows do it's normal software-controlled shutdown and PC power-off. You then switch off the master switch on the power center to remove power from the monitor, printer, etc as well as the PC. The next time you flip the power center's master switch back on, the PC will start up by itself along with the monitor, etc.

In another installation, I externally control power to a PC with an X-10 controller activated by an X-10 Phone Responder dial-in remote control.

The backup server has taken up most of the load from the primary server for a few days, and I have heard no complaints. AFAIK, everything is working on the new server, the only difference will be with long term plots of telemetry, weather, and tracks, where the new server has not been up as long. If something is not working, now is the time to say something...the next week is extremely busy for me.

The name server switch-over should happen in the next day or two, and then everything (other than email, which I will not be placing on the new box) will be handled by the backup server. I'll be taking the primary server offline on January second, doing some updates (doubling memory and disk capacity, and kernal and other software updates), and shipping it out on the third to its new home. I'll be on a cruise (a band cruise with Deanna Bogart, I've produced her last two albums) from the third through the sixth, and essentially unreachable.

To ease the transition, everyone linking to my system or using the database should be using the name www.findu.com, not www1.findu.com, findu.com or an ip address, as these will fail soon. I'm still seeing a load of about 5% of the normal level on the primary server, this is from people not using the www.findu.com name. You have been warned!

Once I'm back and the primary box is online at its new home and synced up, I'll be going to load sharing, where both servers take about half the traffic...the result is the system will be more responsive and less prone to failure.

Thanks for your patience!

Steve K4HG

Anytime you get an IP connection, whether war-driving, Starbucks, or your own
DSL or dial-up, you can connect to the APRS IS...it does not matter how you are
connected to the internet.

If you want to have some sort of automatic software that wardrives, connects,
and sends APRS IS data automatically, that is a little tougher, and probably not
workable at freeway speeds, by the time a laptop senses a network, negotiates a
DHCP lease, and connects to the APRS IS, you are probably too far down the road
to send data.

>Is there some kind of UDP packet that can be sent into APRS-IS wihtout a
>full connection?
>
AFAIK, no one opeens up a UDP part to outside networks, it is a security risk.

After reading the replaies I have come to a conclusion. Please experiment!
That is what Ham is all about. Did Ben Franklin ask permission before flying
a kite in a thunderstrom? Did Edison ask before inventing all of the
wounderful things that make our life easier? Did Bob ask when he decided to
invent APRS? So by all means if you want to experiment then by all means do
so!

I do not want to see Ham become a "Production" or "Out of the box" hobby.
Just an opinion for what its worth.

Peter

>AFAIK, no one opeens up a UDP part to outside networks, it is a security risk.

It is of no more inherent risk than a TCP port! What is at issue is whether a
stream connection is necessary for any particular service. What usually is
the issue is that because microsoft had exploitable ports open on their
machines, everyone decided that NAT, firewalling and proxies were the answer
to access control issues. Now that all of these things are in place, they are
accepted as part of the network.

UDP would be a fine way to send APRS traffic through the internet. Especially
from the perspective that an overloaded host would get implicit help in
shedding the extra load by the kernel layers network buffer management. If we

really want to do more on the internet, we need to standardize on a packet container such as XML for transport.

We could attach public key/signing technologies to packet submission so that packets are signed by the originating call owner. Everyone would be able to not worry about where data was comming from anymore. The core APRSIS servers could include a public key server. This would not necessarily solve problems related to people replaying old packets that are signed, except if we include ignoring duplicates, and demand that the transported packet include a timestamp in the signed data. That would allow the same data to be submitted for a later time, and the signature would take that change into account.

I am still working on my Java based dynamically reconfiguring APRSD implementation. I have it working in a remedial way. You specify a level in the tree of servers to connect to, and it goes and finds something that is at or above that level. When that server goes away, it discovers a new one. The next thing will be to add a container infrastructure such as the above. The software is designed so that you run it on your existing APRSD (or whatever you are running as your IGATE) and just tell your software to connect to localhost:port instead of the remote server. Then, the new trasnpoer infrastructure will be able to be layed over the exising network. What can happen is that at the top level, the servers can be replaced, and they will wrap old format data as they receive it. We can push the new servers out to the lowest levels over time.

The igate servers can then provide some of these new services and we can start experimenting with new features. Specifically, once the data is all wrapped in XML, then new fields will not affect old igates/aprsd/servers. Each will be able to use the data that it is compatible with, and ignore any new tags/attributes that anyone adds to support a specific application/feature they need supported.

AHubEast.net (DNS) is currently down due to a problem with a DNS server. The problem should correct itself in the next 6-48 hours...(I hope). You can connect to it direct: 68.101.46.52:10152 (full feed) or 68.101.46.52:14579 (eastern regional feed). I apologize for any inconvenience this may have caused.

FYI...the AHubEast server will be switching its domain name to fall in line with the other tier 2 servers. The new domain name will be aprseast.net. This should be activated sometime next week...will announce when operational....

There is as presently implemented. Yes, as you say, you could use public key
cryptography to secure it, but the infrastructure to do this is in the dreaming
stage. My statement was in the present tense, and I stand by it.

The big problem with UDP is that there is no ACK. You do not have guaranteed
packet delivery. Sure you could do your own, but that is what TCP is, no need to
re-invent the wheel. Without it, you will risk losing packets when there is
congestion on the network.

In Bob's question, there is a legit reason for using UDP...an app could simply
shoot out a flurry of UDP packets, and in the event that a connection comes up,
you have a better chance of getting a packet through than if you waited for a
TCP connection to open. This is the only reason I've heard for UDP that I find
compelling, but without another layer of authentication, if opens up the APRS IS
to abuse, as there is no accountability with a UDP packet as presently
implemented in the hub software.

Best of luck with your project!

I was speaking specifically of transporting data. The issue of the encrypted
call sign used for auth on TCP connect now is not what I was speaking to.

For position reports and other changing data, ack may not necessary.
Providing a guarenteed service is more costly than a mostly works service that
has certain graceful failures under load.

Granted, but when you talk about public key encryption and XML, you are talking
about large increases in overhead, so why not a small bit more for guaranteed
delivery?

535. [aprssig] pocketAPRS v1.93 Released

```
From: Mike Musick <mikemusick@earthlink.net>
Date: Fri, 27 Dec 2002 22:39:42 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-112664-2002.12.27-23.26.18--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain
```

```
pocketAPRS v1.93 has been uploaded to the TAPR server:

   ftp://ftp.tapr.org/aprssig/palmstuff/palmaprs/paprs193.zip

Changes this version from the previous public release, v1.90:

  - HandEra 330 support finished:
      All data and map screens maximized for use of full screen space;
      Soft Graffiti area automatically managed.
  - Maps on external cards memory error fixed.
      Maximum number of maps is now 50, with no crashing if maximum exceeded.
  - Data logging with export via serial port.
  - Map city labels don't overlap.
  - "Object Display" screen - "Label Limit" now works.

Fixed:

  - Minor cleanups for Palm OS 5.0 devices.
  - Further correction in KISS protocol support.
  - Crash on older devices if "station info" button tapped on map screen
      with no current station.
  - Crash when GPS overloads alert system with conflicting $GPGGA and
      $GPRMC status.
  - Erroneous "blank" values on popup menus, some of which resulted
      in bad beacon data.
  - Crash on color models of Sony CLIE when drawing icons.

Minor glitch for current users is that the coordinate units (DDMMSS
vs. DDMM.mm) will suddenly "swap" your preferences. Simply go back to
the settings screen and re-enter the setting. This is due to a change
in preparation for supporting UTM coordinates as an additional
selection.

I'm still working on changes for the web site; hopefully that will be
mostly updated by the time most of you read this.

Hi Guys and Happy Holidays,

I have a problem I travel a lot and my loved ones track me on APRS if I drop off the map for a time the panic. Does not help if I'm out of range on the cell phones.

Here is the problem:
I can't seem to get my mobile to report reliably setting at my house (the Johnson City, TN IGATE) it works fine. When I am away form the house it's about 10% received and put to findu.

This is the mobile setup:
Motorola 110 watt Mitrex
5/8 wave gain antenna
KPC 3+ with 8.3
Garmin GPS3+ hooked to the serial port on the KPC (not the extra port)

I have looked at several setups and have even set my unporto to aprs via relay, wide7-7 still did not help.

I did get one nice note from someone in Tucson, AZ when I was there last month. He was bitching about the beacon rate when I was still (3 min) and the 7-7 in the path. I wrote him back and explained all this and ask if he could be any help. I guess his gig was just to complain not offer any real advice.

Can anybody help ?

If this is not of general interest then please respond private.

Thanks in advance for any help

Rendered body type: text/plain

Having Wide7-7 (although excessive) doesn't guarantee you will be inputted into the APRS IS system reliably. No matter how many wides you have setup in your unproto, if it doesn't get to an igate, you won't be seen via Findu/or others. If the conditions are just right and there are no collisions, having that monster path might get you into an igate a couple of states from you...but realistically it will "die on the vine" at some point. Where do you routinely travel? Although the APRS IS is very robust in a great many areas of the country, there are some big holes (especially in your area (Tennessee/Kentucky).

Having 110 watts should get you to Jupiter...have you checked to see if your TNC is properly calibrated? If the modulation level is out of whack and causing massive deviation, that could be adding to your problems....

Mark A. Foley, NA4V

Hi Guys and Happy Holidays,

I have a problem I travel a lot and my loved ones track me on APRS if I drop off the map for a time the panic. Does not help if I'm out of range on the cell phones.

Here is the problem:
I can't seem to get my mobile to report reliably setting at my house (the Johnson City, TN IGATE) it works fine. When I am away form the house it's about 10% received and put to findu.

This is the mobile setup:
Motorola 110 watt Mitrex
5/8 wave gain antenna
KPC 3+ with 8.3
Garmin GPS3+ hooked to the serial port on the KPC (not the extra port)

I have looked at several setups and have even set my unporto to aprs via relay, wide7-7 still did not help.

I did get one nice note from someone in Tucson, AZ when I was there last month. He was bitching about the beacon rate when I was still (3 min) and the 7-7 in the path. I wrote him back and explained all this and ask if he could be any help. I guess his gig was just to complain not offer any real advice.

Can anybody help ?

If this is not of general interest then please respond private.

Thanks in advance for any help

Rendered body type: text/plain

Robert,

Have you set your KPC3 for high audio output? It has two settings one for low level and one for high level. Once the proper setting is selected you can use the CAL (calibrate) command for "fine" adjustment. The KPC3's are default to the low level from the factory.

The Motorola Mitrek will require a higher mic input level than the "typical" ham transceiver.

Based on you complaint I'm guessing you might be having too little deviation which results in poor packet decoding unless you are close enough to a digi/I-gate to be absolutely full quieting.

If this is the case, I would recommend increasing the audio output of the KPC3 rather than increasing the deviation level of the Mitrek - assuming the Mitrek is properly adjusted for 5kHz max deviation. The proper AFSK (audio frequency shift keying) deviation should be about 3kHz - certainly no more than 4kHz. Although, the mark tone will be higher deviation than the space. This is because of the pre-emphasis circuit in the transmitter. Once received the de-emphasis circuit in the receiver will (should) make the mark & space levels the same that are sent to the TNC for decoding.

Of course, you'll need a deviation meter (service monitor) to make the proper adjustments. However, you can use a volt meter and another (known) properly adjusted setup - but I won't get into all the details here.

Hope this helps.

Regards,

Richard
kq4kx

>Granted, but when you talk about public key encryption and XML, you are
talking
>about large increases in overhead, so why not a small bit more for guaranteed
>delivery?

It's the two way exchange that I am specifically talking about. Anything in
size up to a single network buffer will not provide any appreciable change in
load on the receiving machine related to receiving data from the network. The
added user space work to process whatever more data may be an issue.

Validating signed data is not cheap, so you are write that there would be
overhead to process signed UDP packets.

Check out John Ackerman's (N8UR) excellent description of packet deviation
issues at:

http://www.febo.com/packet/layer-one/

There's even info on the Mitrek !

Helped me a bunch.

Here's wishing someone would sell an inexpensive deviation meter.

I am trying to find information on programming the D700 with XP. I am
running an HPzt1175 laptop with a Belkin USB to Serial adapter. I can run
aprs programs and they work fine but when trying to program the radio I get
a port timeout error. I am sure the problem is in the Kenwood software. Does
anyone know of a fix to this problem.
I can program the radio with my home computer running W2K and a laptop
running W98 so I know the cables work and that the radio is functioning
properly.

Thanks
Randy K7RNS

Need to ask some ques

1. Do you have a handshaking problem ?
2 What handshaking are you running ?
3. Do you have any other programs using the com port at the same time ?

Where would I find programming commands for a D700 ?

Andrew

I need a source for pre-modified, 110-watt transceivers for use as packet transceivers on 147.585 MHz (the BEACONet frequency). I don't have the equipment to do it. Does anyone know of such a service offered by anyone? "Buck" Rogers no longer offers it.

I need the help of APRS-savvy amateurs in Southern Ontario Canada (near Lake Ontario). Please, tune-in 147.585 MHz and monitor for an hour. Then, please send me a direct message as to what you decode (if anything), it's signal strength, along with your 6-character grid locator.

I may ask that you do this again after a couple of weeks or so. Your help is deeply appreciated.

Kind regards,
Ev Tupis,W2EV

I have gotten a lot of check the radio, deviation, antenna, ect....
Here is the response I have been sending to the people trying to help
(Thanks)
But I think that I have something set up wrong in the TNC.
I'll bring it in over the weekend and print the configuration and maybe
I could find someone to look at it for me.

Thanks again for all the help

73

Robert / KD4PBC

Thanks yes the levels are dead on the money as is the freq. There is a
little "twist" in that the lo tone in about 3 kHz and the hi tone is
about 3.8 KHz. No distortion though good clean sine waves.

Do you have a sample setup in of the TNC that you can send me ? I will
check it against mine and reconfigure if needed.

Thanks again,
Robert Mitchell / KD4PBC

549. [aprssig] ** UPDATE ALERT *** - pocketAPRS v1.94

From: Mike Musick <mikemusick@earthlink.net>
Date: Sat, 28 Dec 2002 21:08:01 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-112770-2002.12.28-21.56.24--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

A big "Thanks!" to James, K9APR, for so quickly picking up on a serious GPS logic bug in yesterday's pocketAPRS release.

It is now fixed (I hope), and pocketAPRS v1.94 has just been uploaded to the TAPR server:

ftp://ftp.tapr.org/aprssig/palmstuff/palmaprs/paprs194.zip

In further testing today I uncovered a couple of minor cosmetic bugs in the HandEra 330 revisions. They should not interfere with normal operation and will be corrected in the next release.

I need a source for pre-modified, 110-watt transceivers for use as packet
transceivers on 147.585 MHz (the BEACONet frequency). I don't have the
equipment to do it. Does anyone know of such a service offered by anyone?
"Buck" Rogers no longer offers it.

Ev, W2EV

Well, I just use a cut off control cable about 2 feet long.

Have the shop ID the PTT, Audio Hi, Audio Lo, Mic Hi, Mike
Lo and Gnd. Attach these to a cable of sufficient length to
reach your TNC with the right connector for your
TNC on the other end. Just clip off the othe wires that you
don't need which will vary by the control cable that you use.

The Power leads should be big and obvious Red 13.8 VDC +
and Black the ground

73 de Ronnei

Thanks Ronnie,
Maybe I've simply been overlooking the obvious. As I go looking for
Mitrex's,
what must I have? Can you give me some insights there? I hear about
"control
heads" and the like. What *must* I have to use these things as packet
transceivers? Can these shops also provide outputs to a common connector
(with
audio in/out and PTT)?

My appologies for my green-horn vision. All I know is that I need 100-Watt transceivers.

Thanks for any insights you can offer.

Warmly,
Ev

I can generate a set of Syntor, SyntorX, and MCX-100 prom images. Anyone with a programmer can program the parts. The MCX-100 and Syntor use an 82S123, rapidly becoming unobtanium. The Syntor X uses a 2816 EEPROM.

Brinkley Electronics builds a board that will let you plug a 2816 in the channel socket of an MCX 100. I presume it will work in a Syntor.

http://www.brinkleyelectronics.com/prog/mot/mcx/mab.htm

I'm working up an image for my MCX-100s that has:

Ch1	144.39
Ch2	144.99
Ch3	145.01
Ch4	145.03
Ch5	145.05
Ch6	145.07
Ch7	145.09
Ch8	146.52
Ch9	146.46

Ch17-26 are the same as 1-9, but with low side RX injection. This is needed for the rare radios that are in the low (136-150.8) band split.

Phoenixes are pretty easy to program according to my friends (I haven't done it.) I don't know about Deltas or Rangrs

557. [aprssig] Afilter problems

From: John Kraus <jfkraus2@cox.net>
Date: Sun, 29 Dec 2002 09:41:07 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-112818-2002.12.29-09.27.18--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I am running AFilter in front of UIview. The past two mornings I have
found the program disconnected despite the reconnect and rotate boxes being

checked. On exiting the program I get a error message as follows:

Exception EInvalid Pointer in module AFilter.exe At 000608848 Invalid pointer

I am running an AMD-K6 500 320mb RAM 80 GB HD

Software is:
Win98se.
Afilter 2.73
UIView 1.86

I am not having any other problems. I have run Memtest86 for 24 hours with no errors from memory so I doubt it is an issue. I did get and "error in ini file" on one start put it never reappeared. I tried deleting the directory and reinstalling and problem came back. The system has undergone a full system virus scan with current definitions since the problem appeared and was clean.

My questions:

Is afilter273.zip the latest package?
Where is the main webpage for the AFilter package?
Are there any known issues with this package?

Note that there is also a plugin called "Infokiosk" that does something similar. Besides that its also standard functionality of the DIGI_NED digipeater.

Speaking of DIGI_NED, I'm currently preparing a single bootable floppy with the digi software and a configuration program to make initial setup extreemly easy. I'm currently testing a change to the driver so even a TH-D7 can be used as digipeater! That way all you need is a PC, cable and TH-D7 to setup an light weight full-featured battery operated emergency/special-event digi.

That was a side step, to the subject of tiny web pages; make sure there is some initial information about it on air and some way to find out all the commands that it knows, otherwise nobody can use it. The way I did it in the sample file of DIGI_NED is by having a default response saying "Use "Help" for topics". So just sending some random query gets you on the right track. "?Help" then points to ?H1, ?H2, ?H3 etc to split the help up because all the Help does not fit on one line. I have a command ?List which lists all the possible queries. Anyway, make it so that you do not need any knowledge at forehand except how to send messages in general.

Kind regards,

Henk.

```
> ps - I picked up a scannere the other day. Is there any 6 meter APRS
> activity to monitor?

Hi Joe,
While I am certain that there is no 6 meter APRS activity anywhere in the known
universe (APRS doesn't work well 'split frequency'), I can tell you that there
is not only scattered BEACONet activity on 53.530 east of the Mississippi, but
that there is about to be a *huge*push* to expand it.  Here's the deal:

0. Other than general questions (like the one you asked) I won't spend alot
   of time discussing BEACONet on this list (see next point).  If you are
   interested, join the BEACONet list by sending a blank e.mail to:
   mailto:BEACONet-subscribe@yahoogroups.com.
1. BEACONet is not APRS, but it uses the same software (UI-View, exclusively)
   o With a hearty pat on the back to Bob, Steve and the APRS authors for
     establishing the first UI-Frame packet service on which BEACONet was also
     based (and would not have been conceived had it not been for my ability
     to stand on the "shoulders of giants"), the mission of the two services
     is entirely different so their infrastructure requirements are different.
     They are incompatible, philisophically; while technically, they are
     "brothers"
2. BEACONet.25 (for Propagation Tracking) lives on 53.530 MHz FM, using 1200
   baud AX.25.
3. There are presently a half-dozen or so 24/7/365 stations scattered around
   east of the Mississippi waiting to tell observers when the band opens.
4. There is about to be a major push to establish more stations in time for
   them to be ready to rumble by the spring Es propagation season.
5. We are within 30-days of having our own Internet data server established
   (quite seperate from the APRS IStream).  It will be called "LIVExchange"
   and will hopefully be the foundation on which we will be able to know
   who is active, even if the band isn't open.  It will be built on Bill's
   AHub product.
5a.This will have the potential of linking all AX.25 BEACONet activity, on
   10-meters (28.128 USB @ 1200 baud), 6-meters (53.530 FM @ 1200 baud) and
   2-meters (147.585 FM @ 1200 baud) to a common Internet-based resource for
   RF to Inet traffic (while *not* going back to RF...that would potentially
   poison the waters for propagation research).
```

5b.Additionally, the BEACONet protocol includes the ability to identify the band from which a signal originated making a single LIVExchange server a good resource.

Anyway...I'm sure this is more information than you needed to know, spawned from such a simple question <smile>. If you are looking for a 6-meter frequency to monitor, try 53.530 MHz. If you would like a .jpg map of the locations of known participants on that frequency, I can send it to you off-list. The map also includes locations of 10-meter AX.25 participants in the USA.

Warm regards,
Ev Tupis, W2EV

561. [aprssig] Programming and Commercial Gear WAS: Modified Mitrex's

From: "Rich Garcia" <k4gps@bellsouth.net>
Date: Sun, 29 Dec 2002 11:02:26 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-112841-2002.12.29-10.46.07--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

And the Delta/Rangr/Phoenix is somewhat easy to program. Mark did not do a plug but I will do a plug for him, he sells circuit boards and built programmers for these radios. If you don't have the time to build then check here.

http://www.cheavens.com/mark/radio/

For those of you who have not used commercial gear before this is what to look at at hamfests and e-bay, they are somewhat inexpensive well built and easy to program.

GE: MLSII (Not MLSI's) these are PC programable the MLSI's need the GE Suitcase
GE Delta/Rangr/Phoenix these use a flip flop and the parallel port to program see link above
MVS Need a TTL to RS-232 interface (Max232chip) and a PC

Motorola: M10,M120,Maxtrac,MCX-1000,GM300 SM-50 or SM-120 All need a Rib Box ($80-120) and software but are good
Syntor, Syntor-X, MCX-100 Need to burn a prom and some shareware off the net, Syntor's need a cheap prom adaptor.

Syntor X-9000 Expensive, need a RIB and special ham software and not very sensitive in ham bands. Lots of channels and a good voice radio but overkill for APRS. Very good front end and the reason it is not very sensitive in the ham bands, it just does not pull in quite that far.

AS far as cost and ease of ham use I would suggest any of the GE's. If you have a little extra cash the Motorola's are good and much easier to find parts for since they are a bit more recent. Radios mentioned will be in the $25-$100 range for GE and $120-$300 range for the Motorola's.

This has been part of a long discussion on the list for many years. Ham equipment does not have a place at commercial tower sites except in some limited cases. #1 the wide front ends will give you problems at multiple high power transmitter sites.#2 Ham gear does not make for a good neighbor unless good filtering is used and that will crank up the price for the site radio. Go with a commercial radio your performance will be much better, you will appear much more professional to those co-located and you will run much less of a risk of interfering. If you are a guest guess who will be booted off ? And it does not make a good impression later on when someone else wants to get on that site or another one that may be owned by the same company.

Actually the cleanest transmitter is a crystal unit. If it is going to be a digi site I would suggest a Mitrek, MastrII, Mocom, or Master ExecII. All can be found for less than $50 (usually $25) a pair of good crystals from West Crystal in B.C would be $22 or a pair from International for about $60 and you are done. A little more work to get on the air but these are almost set and forget radios, real tanks!

Rich K4GPS

Rendered body type: text/plain

I am looking for C source code to access the mySQL findu database. The code should connect to the mySQL findu db, login, and extract APRS position information based upon the callsign. I have done this with perl, but need C.

Rich, W9IF

Fascinating that you ask this question, Joe. I just did a comparison (yet another project that I'm working on) of these transceivers (with the exception of the IC-2100H). In a nutshell, this is what I can tell you from what was important to my project (based on my previous email...you probably know what it is <smile>).

	1500m	2600m	8000
Power Levels	50/25/10/5	60/25/10/5	75/25/20/5
Data-jack for TNC connection	Yes	Yes	No
Transmit Time-out Timer	Yes	Yes	Yes
unique feature:	small footprint	perfect size to co-mount TNC inside mobile bracket w/ the xcvr	highest power commercially made mobile xcvr -and- TNC co-mount inside mob. bracket

In a new initiative called BEACONet.25 (for VHF Contests) it is important for Rover stations to use the highest power possible in order to be heard (simplex) by other BEACONet.25 stations on 2-meters. It is equally important that their BEACONet.25 transceivers be usable to make simplex FM contacts easily. This means that it is important to have a data-jack and high power. The transceiver that bubbles to the top is the FT-2600m for this particular application.

On the other hand... BEACONet.25 (for Propagation Study) relies on a network of high-power stand-alone digipeaters at altitude. For this purpose, the IC-V8000 appears to be the transceiver of choice.

Your needs may be quite different, and results may vary based on that. I hope this helped, though.

Kind regards,
Ev Tupis, W2EV

565. [aprssig] GE MVP

From: kd4ydc@juno.com
Date: Sun, 29 Dec 2002 16:24:53 GMT
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-112846-2002.12.29-11.11.32--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I see everyone talking about the Deltas, Mitrexs, etc. What about the GE MVP's? What mods need to be done on this to make it work on packet? Does the tx and rx crystal needs to be the same? (I guess that is a stupid question) I would also presume that the above question would take care of itself the the relay. GE's seem to be REAL easy to work on.

I have both the FT-1500 and FT-2600 running APRS. 1500 in the car 2600 as a DIGI. Both are working solid and great prices. The 1500 is really a rugged built unit. Only thing I don't like about them is no squelch control. Done using a menu. Really hate those types but for APRS it does work OK. I just like to have a little control but since I never have to adjust the units, it isn't bad. I have the 1500 in the trunk with a TTII going direct to the mike jack. Have the volume turned all the way down so don't even hear or remember it is on. I do get a little overload for the 2m VOICE unit if I don't have the PL turned on. Can't do much about it. Antennas are about 3' apart. Only so much space for antennas on the trunk.

567. [aprssig] Re: GE MVP

From: Robert Donnell <kd7nm@pugetsound.net>
Date: Sun, 29 Dec 2002 08:59:31 -0800
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-112859-2002.12.29-11.45.36--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

MVP's work very well for packet operations. They can also be modified pretty easily for 9600 baud operation, should that become desirable in your situation. The relay used in the MVP's is mercury-wetted (and hence sealed) , so not very prone to wear and tear. They also switch quite fast at about 3.5 mS and have no noticeable bounce. The radio employs time delays in the TX and RX voltage control/regulator, about 70 mS on transmit, and 7 mS on receive. It turns out that removing the RX delay capacitor and using it to replace the TX delay capacitor will change the TX delay to 7 mS and the RX delay to equal that of the T/R switching relay - about 3.5 mS. Some radios with relays are slow - the MVP need not be among them! My favorite way of connecting to the MVP is by way of the power/accessory connector. On all the radios I've seen, the Molex connector has room for additional pins, and these can be used for making connections to the appropriate points in the radio. Done this way, you don't need to have the mike plug installed. You can also modify the squelch board to use the front panel Monitor switch to have the following modes:

1) Squelch forced closed - will not emit noise from the speaker
2) Squelch Normal
3) Squelch Open - on the spring-return position - so when you let go of the switch, it returns to normal operation.

If you've got a TNC that has True DCD operation (will operate with the squelch open), tapping into the radio's receive audio circuits before the squelch audio switch will provide an audio level that's been quite compatible with all of the TNC's I've tried it with. So with the Monitor switch modification, you can set the radio so that the only noise it makes is when the T/R relay operates.

Hope that helps!

73,

Bob, KD7NM

Rich,

Included is a program to retrieve the last position information for a station
from db.aprsworld.net. Compile with something like:

gcc -ggdb -o last -lm  -L'/usr/lib/mysql' -lmysqlclient -lnsl last.c

You should be able to easily modify this for findu.com if you wanted to.

-Jim KB0THN
kb0thn@aprsworld.net

#include <stdio.h>

#include <mysql.h>

/* Mysql stuff */
MYSQL_RES *result;
MYSQL_ROW row;
MYSQL mysql;

void print_lastposition (char *source) {
        char sql[256];
        int i;

        snprintf(sql,256,"SELECT
source,packet_date,latitude,longitude,course,speed,altitude,status FROM
lastposition WHERE source LIKE '%s'",source);
        mysql_query(&mysql,sql);
        result = mysql_use_result(&mysql);

        while ( row = mysql_fetch_row(result) ) {
                for ( i=0 ; i<8 ; i++ ) {
                        printf("%s ",row[i]);
                }
                printf("\n");
        }
}

int main(int argc, char **argv) {

        if ( argc != 2 ) {
                printf("usage: %s callsign\n",argv[0]);
                return -1;
        }

         mysql_init(&mysql);

        if (!mysql_connect(&mysql,"db.aprsworld.net","guest","")) {

569. [aprssig] Help with UI-FLOOD (WIDEn-N) and MYALIAS (RELAY)

From: "Ev Tupis (W2EV)" <w2ev@arrl.net>
Date: Sun, 29 Dec 2002 12:23:26 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-112861-2002.12.29-12.12.37--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Is UI-FLOOD the same command across all TNC manufacturers (Kantronics, Pacomm, MFJ, etc.) or does each one invoke it differently? I'd like to know the manual command to invoke WIDEn-N,NOID digipeating in each.

Ditto RELAY digipeating. Is it all centered around setting MYALIAS to "RELAY"?

Can anyone offer any insights, please?

Ev, W2EV

Subject: [aprssig] Afilter problems

I am running AFilter in front of UIview. The past two mornings I have found the program disconnected despite the reconnect and rotate boxes being checked. On exiting the program I get a error message as follows:

Exception EInvalid Pointer in module AFilter.exe At 000608848 Invalid pointer

I am running an AMD-K6 500 320mb RAM 80 GB HD

I'm running Afilter 2.7.5.2, and have been getting "Invalid Pointer" windows popping up also. This is the first version of Afliter I have ever run so I don't have any history for previous versions.

Afilter does not "crash" though and seems to continue on, doing what it's supposed to. Running this on Windows XP Pro.

Rendered body type: text/plain

```
While searching the web for a weather station finally I see that there are a
LOT of web based stores selling the same thing. Does anyone have a
suggestion for who seems to be the best dealer and price on the Davis
Weather stations ? I am torn between the WX-200 from Radio Shack for $399
(plus a 10% discount I get there) and stepping up to the Davis Vantage Pro
Wireless. I guess the Oregon Scientific is the same as the RS but I have not
checked which one would actually come out cheaper.

 Obviously you know very little about ham radio outside of your little
niche. QRP-L list has 3-5000 subscribers almost all of whom are active CW
ops. I figure about 3-5 more CW ops for each one on QRP-L ... that is a lot
of who! I dunno what parts of t he bands you  listen to but I can find nice
readable fists anytime I chose to indulge. As for high speed senders,
because of persistence your brain couldn't even begin to separate  300 wpm!
However there are more than a few very competent ops who can cruise at
40-50+ wpm without the help of any computer and do.

Steve spoke of innovators needing a thick skin when submitting ideas for
'peer review.' He is right, as fart as that goes ... but there is a vast
difference between  being a source of constructive criticism and being a
prophet of doom and gloom .... If you feel that way about ham radio, why on
earth would you wish to continue to be a ham? I mean ... It must be
revolting to your sensibilities to have to rub elbows with all those sloppy
fists and people with purloined licenses!

577. [aprssig] Low current-draw mobile/base radio for mountaintop APRS?

From: "Casey Hicks" <casey@tenforward.com>
Date: Sun, 29 Dec 2002 19:22:15 -0800
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-112914-2002.12.29-22.10.18--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi everyone;

I have a possible APRS application that requires the need for a commercially-made mobile radio (or base capable of a 12-15V input) that has a receive current draw of 100 mA maximum with TX output power capable of a minimum of 4W. If there's something out there stock or that requires internal mods, please let me know about it - it would be greatly appreciated. It will be connected to KPC3+ units for mountaintop gap-filler RELAY digis at a couple solar/wind sites.

Please email me OFF THE LIST. Thanks.

Rendered body type: text/plain

An addendum to my inquiry:

I guess I should have been a little more specific. I'm looking for a mobile/base radio capabile of a RECEIVE current draw of 100mA. I can deal with the standard TX current draw (for 4-5 watts it's about an amp or so).

You might want to check out this link.
http://www.gpstracker.com/sr125.htm

It is a small no-frills radio that seems like it would be a good choice for
a low power remote station.

```
Input Voltage:          9 - 18 vdc, 12V Nominal
Current Drain:           9V     13V     18V
        Standby                         57ma    42ma    32ma
        Receive                 72ma    63ma    58ma
        Transmit                        1.8A    1.4A    0.9A
```

Color me blind I guess.

Some good info there on the CW stuff, but no where do I find a way to
link a CWxxxx number back to a person or contact point.

Be some handy info to find!

There's a CW station here in Casper (CW0882) that's showing up on the
'regular' APRS-IS feed, but seems he's not showing up on the APRSWXNET
feed - least not on any of the pages I found via your link there Dick.

Even more intriguing is the Q construct for CW0882's strings (qAX,
CW0882). Way I read it, it says it's going into the I-net via CW0882 (a
single station 'weather gate'). So I'm assuming he's simply connected to
one of the regular APRS servers someplace rather than your APRSWXNET
server.

Any fills?

I answered Bill's original question off-line, but perhaps I should have sent
the response to the list. Anyway, here's what I sent to Bill about how to
find out who the Citizens are who are contributing their weather data for
use by NOAA and other users.

On my web page, www.wxqa.com , there is a members list that you can do a
search on to find the name and location of the person. Then go to the maps
and display section and click on the state that the person is from and find
the CWxxxx in the list and you'll see several links to look at their data.
location, raw packets, etc, and you can send them an e-mail just by clicking
on the appropriate place.

I think you mean CW0822 in Casper.

CW0822>APRS,TCPXX*,qAX,CW0822:@300658z4252.00N/10620.43W_257/018g...t031L000P000h00b10069.DsVP

The CW0xxx users simply send data to APRS using special programs. Usually
anywhere from 5 to 15 min. intervals. They don't stay connected to any of
the servers. The qAX doesn't show which server he is connecting to. If I
enable the q trace at my server the packet would appear with path
information:

CW0822>APRS,TCPXX*,qAX,CW0822,APRSWestX:.......

We don't generally q trace packets, unless we are trying to determine the
cause of a problem with the feed, or looking for the source of bad packets.
In which case, the q path could get very long... as the packets hit
multiple servers.

We have 3 WX servers that do an excellent job error checking the CW0xxx
users, not to cause problems on the APRS IS feed. They are connecting to
no-echo client only telnet ports. They can only send data using one
connection from a single IP address and only one connection with any single
login is allowed at any time. Their connections are tagged TCPXX* as
unverified clients.

Should mention that this program for the CWOP's has been going strong for
over a year. Many Hams are also using these programs as a very effective
way to send WX data to the I-net, from their WX stations.

If your browser supports java, visit http://wx.kb7zva.com to get an idea as
to how many wx stations there are world-wide on APRS. It is a real-time map
display. This project from the start has been tons of fun.

I
loaded in .pos for a local hospital, police station, electronics store,
two
repeaters and a weekly net. A message sent to my home station of "??" will
return the command options (?HOSP, ?POL, etc.). A message sent with the
command line will post an object that can be navigated to. Very cool and
easy to use! It worked flawlessly with my D7.

Next time you are in southwest Houston (near Sugar Land), try it out!

73 de Bud
KB9WVG

The UI-View TWP server does not strictly follow the specs by Bob Bruninga,
but it does react on messages send to QDOS or QUERY.

Maybe the next version will be more strictly , but then I will need some
better documentation from Bob on the different file types and their
relation/function.

What I tried to accomplish is to allow only local queries (since the server
is for local information only).

Please let me know if there are problems / questions

Good luck with it.

Yea - it's CW0882 in Casper.

OK - likely I'm not understanding how the 'Q' construct is working here.

If I look at a posit from any of the other stations (on RF) in the area,
they all indicate something like:

qAr,KC7ZRU*

I thought that meant that packet entered the APRS-IS via KC7ZRU. Since
that's the only I-gate in the local area I'm pretty confident my
assumption is accurate.

I assumed that qAX, CW0882 meant that packet entered the APRS-IS via
CW0882. That's the assumption that apparently is inaccurate.

Different question:

It was my understanding that since these stations are connecting via the
APRSWXNET server they weren't a 'normal' part of the APRS-IS traffic?
Going back to all those "Sea of Blue" posts from back when.

Now it seems they are? At least CW0882 'popped' up here a few weeks ago

```
for the first time. Maybe just a new station?

Or was my 'seems' simply messed up from the get go.

Actually, that assumption is correct.  The Q construct is identifying the
i-gate or user which has transmitted the packet onto the APRS-IS, whether
it be a true i-gate or individual station.  In the case of the i-gate, it
is the i-gate that is logged into the APRS-IS server, so its call is shown
for all the packets that it gates.  In the case of the CWOP, that user's
station is logging in directly to the APRS-IS server, so its call is shown
instead of some other i-gate.  Essentially, the packet from CW0822 DID
enter the stream from CW0822.

I believe that Dick has briefly touched on what the CWOP/APRSWXNET program
is, and the APRSWXNET webpage explains it in more detail.  It essentially
uses the APRS-IS to provide the NWS with additional, reasonably accurate
weather data from the "average Joe on the street", without having to go
through the more tedious reporting system they have had in place for years.
 It's a wonderful example of cooperation between hams, non-hams, and the
NWS.

The project that caused the "Sea of Blue" traffic is completely separate
from the CWOP program.  That project, APRSFIRENET
(http://www.aprsfire.net), now resides on its own server system separate
from the APRS-IS, and has in place some safeguards to help prevent the
```

re-occurence of that event.

I hope this answers at least some of your questions!

I have experienced similar problems with AFilter 2.7.3. Whether connected
to an APRS-IS server or my UI-View server on my home LAN, after a period of
time AFilter quits receiving a feed, but remains in a connected state.
When I hit the disconnect button, I receive an "Invalid Pointer" message,
but can reconnect and continue until the next time. It usually happens
within 10 to 30 minutes.

I am also running it under WinXP Pro, on a PII 333 laptop with 320MB RAM.

A new copy of Afilter has been uploaded to the main site.
www.wa6oft.com/dnld.htm

Version 276   Afilter276A.zip

I should note that it does not address the issue below...just a new version.
I run 3 or 5 (can't remember) Afilters of various versions and have not
experienced
the Invalid Pointer. It would be interesting to hear how you are set-up on
your network...firewall, etc.

Jim, WA6OFT

589. [aprssig] SAFIR Digipeating

From: Bob Bruninga <bruninga@usna.edu>
Date: Mon, 30 Dec 2002 08:58:39 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>

Message-ID: <LYR842-112963-2002.12.30-08.44.48--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The good news about this is that 1200 baud APRS mobiles driving around can simply QSY their mobiles to 435.275 during a SAFIR pass and with no other configuration changes, will be digipeated by SAFIR. Now all we need is more IGates monitoring 145.825 for 9600 baud as well as 1200.

But, because the global APRS data base FINDU.COM cannot tell that the packets were digipeated by SAFIR, there is no way to build a dedicated web page unless we do something special.

Maybe if we set up the ground IGATES with the alias of SAFIR and have them digipeat, then the packets will contain the needed SAFIR* that FINDU.COM needs. The question is will the monitroing TNC digipeat the packet and include it "so marked" in the data stream? I think maybe not... Unless there is a command to change that...

One of the cool things about the userspace Linux (and solaris) soundmodem program is that you can run multiple decoders on a single input. So I could have the discriminator output from my rig fed into the sound card and have both a 1200 and 9600 baud decoder running on it. Each would be its own device (either an ax25 socket or a virtual servial port) and can therefore have its own instance of aprsd running on it.

If someone can confirm this works, then we can ask Steve Dimse to add
SAFIR* to the PCSAT web page as a simple way of capturing these packets
to a WEB page..

Henk, the U.S. version of the D7 doesn't transmit correctly formatted packets
(it transmits something, but I don't have the equipment to discover what) in
KISS mode.  So, are you going to just support WIDEN-n digi without callsign
substitution?  That is, if the path only contains WIDE2-2, KISS is not
necessary because you can rewrite the path to WIDE2-1 and retransmit it
without having to set the 'used' flag in the AX.25 header...

```

No, it uses the TH-D7E in KISS (sort off, it requires a lot of specific handling to keep it running...). The early E versions did not do KISS correctly (did not transmit at all). I have a small hope that the latest US versions also have a semi-working KISS, but I got mixed reports on that. I heard the same you just said but I also heard claims from others that it works. Best would be if somebody could test the different versions (or send me your US versions....).

If it is indeed sending something but wrong formatted then maybe it is possible to counter-act. If at least the TH-D7A(G) would work than that would also be a step.

Anyway, when I'm satisfied with the results on my TH-D7E 2.0 then I will make the stuff available. I think we will know soon enough which ones works and which one don't (if any...).

Kind regards,

Henk.

Fair question. Many CW0xxx users are hams like you and me. Some have got their ham tickets after being exposed to the things we do, as hams. I volunteered my server to handle a common place for them to reside. We now have 3 wx servers linked together to handle the traffic. I would find it hard to define what's 'normal'. What's normal is that the APRS IS works pretty much like the internet itself. It is unmanaged, and still works well. We have created tiering of the original concept. Not everyone wanted to see the same things. Level 2 (Tier 2) servers came along, and we added specialized ports that handled certain traffic, like regional zone servers (one of many, Sats etc.). Weather and the APRS IS seem to go together well in our hobby. Weather seems to be a primary asset to the APRS IS and amateur radio.

Dick

Wis. Man Charged With High-Tech Stalking
Authorities Say Wisconsin Man Stalked Ex-Girlfriend With Global Positioning Device

The Associated Press

KENOSHA, Wis. Dec. 30 -
A man was charged Monday with stalking his former live-in girlfriend with help from a high-tech homing device placed under the hood of her car.

Paul Seidler, 42, was arrested during the weekend. On Monday, he was charged with stalking, burglary, second-degree reckless endangerment and disorderly conduct, and ordered held on $50,000 bail.

According to a criminal complaint, Connie Adams asked Seidler to move out of her apartment Oct. 25 after a three-year relationship. Prosecutors say he immediately began following her, including when she ran errands and went to work.

Investigators checked under the hood of Adams' vehicle and found a Global Positioning System that uses satellite and digital cellular technology to pinpoint a target's location.

Seidler's attorney did not return a telephone call Monday seeking comment.

A preliminary hearing was set Jan. 8.

Sure does james!

And thanks - my base assumption, that was inaccurate, was that all CW stations were part of the original sea of blue. They're not!

Cool and thanks to all those that answered privately, too. This SIG missed some good info.

Rendered body type: text/plain

Hi Wes,

You need Pmap 5.x. Version 3 won't work. Go to Roger's site and follow the links. Also, install EXACTLY the way he indicates. He went to a lot of trouble to have things work right. Then people go off and "do their own thing", end up with a mess and we spend day after day trying to fix the problems on the list. <g> I think you should post a message on the ui-view32 list, indicating that you installed PM 3, exactly what steps you took when doing it. I think you are going to have a bit of a clean-up problem left. Start your message with:

"I made a mistake and tried to get UI-View32 to work with PM 3.x. I did the following things:

a.
b.
c.

Obviously, I need version 5.x. What cleanup work do I need to do, to successfully "get back to a vanilla install"? I may or may not install PM 5.x, so if there is leftover junk from my goofed up install, please tell me how to clean it up."

The link to purchase Precision Mapping 5.x is on Roger's site. That's where I got mine.

There are MANY more things about UI-View32 that you will end up liking. The add-ins are amazing.

We are in the process of converting most of the main aprs users in central Iowa to UI-View32 for the smart digi capabilities. This will allow us to service the WIDEn-n and TRACEn-n travelers as they move through Iowa because UI-View32 has internal support (with TNC in KISS mode) for:

1. Multiple Aliases
2. WIDEn-n
3. TRACEn-n

So far we have had not one person who has changed to UI-View32 be unhappy. Per my other post, it's fast, efficient, SUPER STABLE and supported extremely well. (and it's cheap!).

The UI-View mailiing list is very helpful. It's focus is UI-View32 and NOT theoretical nit-picking.

p.s. I can't emphasize enough READ AND FOLLOW THE INSTRUCTIONS. Roger has gone to great lengths to help people get started successfully. The example comes to mind that ONLY PM 5.x is supported. This warning is in the PM Map and PMap Server sections of the instructions on the web page. The UHE problem isn't "real"...it is produced by doing exactly what the instructions say not to do. <VBG>

p.p.s. You aren't stuck...you just have to use different maps that you can still get for free. (READ THE INSTRUCTIONS) If you wan't dynamically zoomable maps, you need PM 5.x. If that isn't necessary, you can use all sorts of maps.

If you're still confused, come to the ui-view list and post a series of questions. I'm certain you will get good answers.

...hasan, N0AN

600. [aprssig] For what it's worth.... winaprs IGATE

From: wes@johnston.net
Date: Tue, 31 Dec 2002 07:04:48 -0800 (PST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-113066-2002.12.31-09.50.56--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I usually don't slam anyone or any software on the sig and try to always sound optimistic, so you have got to understand how angry this has me to cause me to write this. If anyone can correct any of my facts, please, please do so. I really hope I'm not off on a rant here!

Since moving to a house which is just slightly west of 84°23' , I have noticed a bug in winaprs. My kenwood radio sends a mic-e position report on the air and it bounces along happily on RF. It's even displayed properly in winaprs when received off the air. Winaprs for some reason translates the mic-e packet (legacy support for mic-e illiterate aprs clients?) to an uncompressed aprs packet.

for example:

```
KD4RDB-14>SSUT3R,KD4HTW-9*,WIDE,WIDE2-2,qAS,KD4HTW-2:'lD>o^%v/]"5)}
```

becomes

KD4RDB-14>APK101,KD4HTW-9*,WIDE,WIDE2-2,qAS,KD4HTW-2:@311152z3354.31N/08040.33Wv209/036/Mic-E/M0/Off duty>o^%v/]"5)}

The problem comes when the translated copy of the packet is put on APRS IS. The translated copy moves the position of the station west about 0.2 mile. This is not just a phenominon at 84°23'w... I have heard complains about it all across the USA. I am unsure as to the boundaries of this error. It could be that it's just a problem from xx°23'w to xx°25'w. I don't know. What I do know is that most of the time, the translation works fine, but in the case near my house (ie certain longitudes) it does not. This problem is repeatable. I have watched my van using aprs SA, parked in my yard TX its posit and appear correctly in the yard. As the posit propogates thru the system, eventually, it ends up on APRS IS, and my same copy of aprsSA, the posit of my van suddenly jump .2mile to the west as the garbled posit comes down from the aprs serve feed. The QaS structure was a great help in tracking this problem down.

WinAPRS is a popular program run my many folks providing IGATE services. Because there is no way for the users to turn off this translate function, we are stuck with broken software. I am no longer running winaprs. I switched to aprsSA about a year ago b/c of this problem (and just started tinkering with UI-View). The problem is that my posit is relayed to the internet by other winaprs stations which I have no control over and those positions are in error. Because they are far away from me, the packets arrive after my good igated packet positions, and findu is stuck with the last report being bad.

I have personally written the Sprouls about this and got NO RESPONSE at all - not even a "thank you for your concern" email. I have railed about this on the aprs sig on three occasions in the past year and had offers from kd4htw (my nearest IGATE neighbor) and others to do whatever he/they needed to do to help.... still no fix from the sprouls. The really silly thing here is that all it takes to fix this problem is to just turn off the translater. It doesn't even have to be fixed... just turn it off.

What I'm asking is for people to consider using other IGATE software since it is appearant winaprs isn't going to get fixed. For many users, Aprs SA has the disadvantage of not displaying icons on the map. It has the BIG advantage of Brent's terrific support. UI-View must be registered to work with precision mapping 5, but allows for dynamic zooming as needed and has beautiful icons and only costs $16 to register. Both of these programs are loaded with bells and whistles.

73
Wes

Mistake already... my house is west of 80°23'w not 84°23'w as listed in the earlier post.... was in atlanta this weekend, and got used to seeing 84 longitude... whoops.

Rendered body type: text/plain

Is anyone familiar with any Maritime Charts available that could be used with UI-View?

Thanks,
Eric KF4OTN

On 12/31/02 at 7:04 AM wes@johnston.net sent:

>The problem comes when the translated copy of the packet is put on APRS IS.
>The translated copy moves the position of the station west about 0.2 mile.
>This is not just a phenominon at 84°23'w... I have heard complains about it all
>across the USA. I am unsure as to the boundaries of this error. It could be

This has been explained many times on the SIG....this is the error which originally led to the erroneous conclusion that the APRS IS mangled non-printing characters.

The problem is not, to the best of my knowledge, within WinAPRS...it is between the TNC and the Sprouls code. Apparently some TNC's filter these characters, if there is a parameter controlling this, at least in the Kantronics TNCs.

This error does not occur on all WinAPRS installations, and it occurs in other programs as well. It also is not a problem inherent to the conversion, though different conversion algorithms produce different errors, but all will produce an error when a character is eaten.

For the record, I asked the Sprouls about 18 months ago to remove the conversion, because it is not needed or useful.

Slam away! You are correct, that bug has been in Winaprs for years. I first noticed it when a friend bought a D700 for his mobile. My WinAPRS IGate put him all over the place. WinAPRS never got fixed, for whatever reason's. Yes, the issue is support.

As a result, hams have migrated to other programs that work. I migrated to UI-View months ago... from my 'support experience' with Roger, I can say it's first class. He has a support forum with over 1,800 users. He answers 'ALL' questions, and does it like you are part of his family. His answers are direct, to the point and easy to understand. If there is a bug in his program, it gets fixed!

Recently he added PMap support, NWS Shapefiles for us 'colony' users <g>. In my opinion, there is nothing better than UI-View if you run an IGate, compared to WinAPRS. I could come up with a whole list of differences. I have never seen a single 'Unhandled Exception Error' in UI-View <g>.

I've also heard good reports on a few other programs. There are some good choices out there, with great support. I'm sure we will hear about them.

Migrate to what works best for you, and enjoy the hobby.

Happy New!

Rendered body type: text/plain

Hi All,

I am interested in purchasing a trunk-lip-mounted antenna, such as a Diamond or Comet antenna. I have a few questions with regards to the actual trunk mount, and if you use such a mount, would you please respond to my questions via email? The type of mount I am referring to is the one that attaches to the lip of the trunk -- it kinda slides on over the metal and is secured by set screws from below (no holes are needed on the car).

-- How do you like a trunk mount?

-- How well does it remain secured tightly after driving around town, or at high speeds on the freeway?

-- Is there a problem with water stains (mineral deposits, etc.) around the area of the mount that is over your paint job? I get those annoying rings when it rains here in New Mexico (yes it does that here...even snows!) and I leave my mag-mount on the car...takes a long while to get rid of them.

-- Any other comments on your trunk-lip mounted antenna?

609. [aprssig] DIGI_NED floppy V1.0

From: Henk de Groot <henk.de.groot@hetnet.nl>
Date: Tue, 31 Dec 2002 17:02:41 +0100
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-113103-2002.12.31-13.59.58--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello,

With great pleasure I announce the availability of the first boot-floppy distribution of DIGI_NED. At this time the software is stored on my own page as this was the most simple to do now. Maybe it will move to the main digi_ned site later.

Address: <http://www.homepages.hetnet.nl/~pe1dnn>

This disk is meant to be able to quickly deploy digis and to give a quick start to those that want to get started with DIGI_NED. Its using DIGI_NED 0.3.3, but does not contain the full distribution! For that download the package from the main digi_ned site.

Its experimental (as this is the first release :-)). I tested this at home but of course there are more configurations than I can make and verify myself. If there are problem's please inform me.

This floppy includes a new version ax25_mac that is capable of handling the TH-D7 TNC in KISS (if the TH-D7 supports it). It works fine with the TH-D7E V2.0 now. I hope to received reports if it works with the US versions too.

Good luck, this definately the last software I am releasing this year!
Happy new year and best whishes!

Kind regards,

Henk.

Info.txt:

About this software:

The enclosed DIGIFLOP.EXE is a self extracting 1.44 Mb disk image, build with a Freeware program called "DI" which can be found on the disk after creation. Use a fresh formatted 1.44 Mb floppy for this (format a: /U)!

After creation of the disk you will have a bootable DISK with a complete DIGI_NED digipeater. As DOS Caldera DR-DOS 7.03 is used; this version of DOS is free for non commercial personal use. Read LICENSE.TXT, please respect Caldera's License. Also read README.TXT on the disk.

After booting the first time a configuration screen appears. You can fill this in. Navigation is done with TAB and Shift-TAB and function keys. F3 gives help on a field. You can choose 16 different predifined configurations.

You can also make customized floppies by editing DNCONFIG.INI and making a matching "RUN.BAT" (in the DIGI_NED directory). You can make your own disk-image with the included disk image tool.

After configuration the DIGI_NED files are copied to Ramdisk, this is also done after a reboot. For this to work your PC shall be at least a 286 with 1 Mb memory.

Don't be alarmed if files seem to be copied to "C:", it just means that the Ramdisk was created as "C:" because your harddisk was not recognized; Caldera

DR-DOS does not understand FAT32 disks. If you have many harddisks and even use drive "F:" then you should be carefull, the floppy checks from "F:" down to "C:" to find the ramdisk. If not sure make a backup copy of your "\Autoexec.bat", "\Config.sys" and "\Command.com" files, that are most likely the only ones that are overwritten should the software use your harddisk instead of the ramdisk.

This floppy includes a new "AX25_MAC" driver. It is possible to use a TH-D7 as digipeater, that is if the TH-D7 understands KISS like the TH-D7E V2.0 does. I don't know if it works with the US TH-D7's, try at your own risk.

This specific THD7 driver knows about the limitations of the TH-D7 and tries to avoid hangups. There is a build-in watchdog that tries to recover from TNC hangups if they occur. For my TH-D7E V2.0 this works fine. Please note that this is experimental code, so if you have problems please report.

During operation you may notice that the TH-D7 is reinitialized. There are 2 possible reasons for this:

- The TNC hangs and does not send any RX data anymore, this is the build-in recovery procedure
- There is just no RX data and the internal watchdog runs off, this happens when there is low traffic. Initialisation takes about 3 seconds and since it is low traffic anyway this is I think acceptable (and there is just no other option...).

There is no sofisticated way to know if the TNC hangs so the drives watches if still data is received after it did a transmission. The away the driver is now it was possible to run for one day without any TNC hangup (disabled the watchdog and looked if it kept running). Watchdog time is 30 seconds after the last transmission.

If you use KISS, then the software will put the TNC in KISS mode. It will try different methods; first the method for the TheFirmware/WA8DED, then "KISS ON" followed by "RESTART" and finaly "KISS ON" followed by "RESET". Be sure not the switch on the TNC on half way during this process as "RESET" will wipe all information in the TAPR TNC-2. In the normal sequence this is not a problem since by the time the RESET is reached the TNC is already in KISS and ignores it.

If you TNC remembers KISS mode and you want to get it out of KISS again, use:

```
.\kissinit -PCOM1 -K
```

(for COM1, for documentation of KISSINIT look in the KISS directory on the floppy disk)

If you want to run the configurator again, remove DNCONFIG.BAT from the root directory of the floppy and reboot.

This is as out-of-the-box it gets! Good luck!

Kind regards,

Henk - PE1DNN

Well, I was unaware of this error, but the biggest complaint I have about it is
the number of extra packets that get sent to the RF network. Here in

Southern
California, it is a large problem. There is one WinAPRS station down in
the Long Beach area that is not even an IGate, but is connected to both the
internet and RF. When I travel around the L.A. basin using my TH-D7, I'll
hear my position packet repeated between 6-10 times. I set up some logging
software awhile back to trace the packets, and I found this station sending
out the translations at WIDE2-2 (which in L.A. means that 6 or more digis
could pick up the transmission). Add my name to the list of registered
WinAPRS users that emailed the Sprouls about this problem.

I have both a Diamond and Comet. Never had a bit of trouble with either
one. One of them is a model 600. Not sure which but it is really raining
hard and I'm not going out just to check. The other has more adjustments
but not as nice looking. The one that has more adjustment has the Yaesu
ATAS antenna while the 600 has a 4 band Diamond antenna.

Hmm, this is 'generic' enough that I'll post here too...

I've used trunk mounts for years. I have a Diamond dual-band (the 770
in chrome with foldover and the NMO mount, I forget the actual model
number) on my Intrepid now. Love the antenna!

> -- How do you like a trunk mount?

It's ok. If you don't want to drill but want a 'secure' mount, it's a
good
choice.

> -- How well does it remain secured tightly after driving around town, or
at
> high speeds on the freeway?

I've never tightened mine now in maybe 6-7 years. (A 93 Intrepid, put on
probably about 1995.) In the past I've had other trunk mounts, and I've
never had to retighten one of those, ever. The key is they have to be put
on tight to begin with. All the ones I've used the 'bottom setscrews' all
have to 'bite' through the paint into the metal and be quite snug.

> -- Is there a problem with water stains (mineral deposits, etc.) around
the

Well, seeing as how it will be years till I take it off... yes, it WILL
be
discolored. But then, that's the price you pay.

> -- Any other comments on your trunk-lip mounted antenna?

One thing people tend NOT to check is when the trunk is open! If
your trunk rises to the point that something 'straight up' on the deck
can hit the rear window....   BE CAREFUL OF CLEARANCES!!

Another issue. I had a Dodge Daytona a few years ago. I went to
mount a trunk lip mount on the top of the hatch. It wouldn't work.
The problem was the hinge. The top lip of the hatchback actually
dropped DOWN as the hatch went up! No clearance at all for
the mount!

CHECK things where you plan on mounting BEFORE you start
actually trying to mount it. After you shatter the rear window or
bind, bend, and scrape the rear deck is NOT the time to mutter
"Opps, I should have thought of that!"

Mike

You Said: For many users, Aprs SA has the disadvantage of not displaying
icons on the map. You must go to the middle tool bar (MAPS, TRACKED,
CUSTOM, WX). Click on the down arrow beside the MAPS Tab. When the drop
down shows click on "Views" then click on "Icons" This will turn on
Icons. It should be noted that if you move the map or change the
magnification the Icons will not reappear. Hope this helps. Happy New
Year. 73 de KC8DRE Bill
